

### +/- 15kV ESD Protected, +3V to +5.5V, Low Power, 250kbps, RS-232 Transmitters/Receivers

The Intersil ICL32X7E devices are 3V to 5.5V powered RS-232 transmitters (five)/receivers (three) which meet EIA/TIA-232 and V.28/V.24 specifications, even at  $V_{CC} = 3.0V$ . Additionally, they provide  $\pm 15kV$  ESD protection (IEC61000-4-2 Air Gap) and  $\pm 15kV$  Human Body Model protection on transmitter outputs and receiver inputs (RS-232 pins). Targeted applications are ISDN Terminal Adaptors, PDAs, Palmtops, peripherals, and notebook and laptop computers where the low operational, and even lower standby, power consumption is critical. The ICL3217E's efficient on-chip charge pumps, coupled with an automatic powerdown function, reduces the standby supply current to a  $1\mu A$  trickle. Small footprint packaging, and the use of small, low value capacitors ensure board space savings as well. Data rates greater than 250kbps are guaranteed at worst case load conditions. This family is fully compatible with 3.3V-only systems, mixed 3.3V and 5V systems, and 5V-only systems, and is a lower power, pin-for-pin replacement for '207E and '237E type devices.

The **ICL3217E** features an **automatic powerdown** function which powers down the on-chip power-supply and driver circuits. This occurs when an attached peripheral device is shut off or the RS-232 cable is removed, conserving system power automatically, without changes to the hardware or operating system. The ICL3217E powers up again when a valid RS-232 voltage is applied to any receiver input.

Table 1 summarizes the features of the devices represented by this data sheet, while application Note AN9863 summarizes the features of each device comprising the ICL32XXE 3V family.

### Features

- Pb-Free Available as an Option (see Ordering Info)
- ESD Protection for RS-232 I/O Pins to  $\pm 15kV$  (IEC61000)
- 5V Lower Power Replacement for MAX207E, HIN207E, HIN237E
- Meets EIA/TIA-232 and V.28/V.24 Specifications at 3V
- Latch-Up Free
- On-Chip Voltage Converters Require Only Four External  $0.1\mu F$  Capacitors
- RS-232 Compatible with  $V_{CC} = 2.7V$
- Automatic Powerdown ( $I_{CC} = 1\mu A$ , ICL3217E Only)
- Receiver Hysteresis For Improved Noise Immunity
- Guaranteed Minimum Data Rate . . . . . 250kbps
- Guaranteed Minimum Slew Rate . . . . .  $6V/\mu s$
- Wide Power Supply Range . . . . . Single +3V to +5.5V

### Applications

- Battery Powered, Hand-Held, and Portable Equipment
- Laptop Computers, Notebooks, Palmtops
- Modems, Printers and other Peripherals
- ISDN Terminal Adaptors and Set Top Boxes

### NOTES:

1. Most surface mount devices are available on tape and reel; add "-T" to suffix.
2. Intersil Pb-free products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which is compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J Std-020B.

## Pin Descriptions

PIN	FUNCTION
V <sub>CC</sub>	System power supply input (3.0V to 5.5V).
V+	Internally generated positive transmitter supply (+5.5V).
V-	Internally generated negative transmitter supply (-5.5V).
GND	Ground connection.
C1+	External capacitor (voltage doubler) is connected to this lead.
C1-	External capacitor (voltage doubler) is connected to this lead.
C2+	External capacitor (voltage inverter) is connected to this lead.
C2-	External capacitor (voltage inverter) is connected to this lead.
T <sub>IN</sub>	TTL/CMOS compatible transmitter inputs.
T <sub>OUT</sub>	±15kV ESD Protected, RS-232 level (nominally ±5.5V) transmitter outputs.
R <sub>IN</sub>	±15kV ESD Protected, RS-232 compatible receiver inputs.
R <sub>OUT</sub>	TTL/CMOS level receiver outputs.

# Typical Operating Circuit

### Absolute Maximum Ratings

V <sub>CC</sub> to Ground	-0.3V to 6V
V <sub>+</sub> to Ground	-0.3V to 7V
V <sub>-</sub> to Ground	+0.3V to -7V
V <sub>+</sub> to V <sub>-</sub>	14V

### Detailed Description

The ICL32X7E interface ICs operate from a single  $+3V$  to  $+5.5V$  power supply, guarantee a 250kbps minimum data rate, require only four small external  $0.1\mu F$  capacitors, feature low power consumption, and meet all EIA RS-232C and V.28 specifications. The circuit is divided into three sections: charge pump, transmitters and receivers.

#### Charge-Pump

Intersil's new ICL32XXE family utilizes regulated on-chip dual charge pumps as voltage doublers, and voltage inverters to generate  $\pm 5.5V$  transmitter supplies from a  $V_{CC}$  supply as low as  $3V$ . This allows these devices to maintain RS-232 compliant output levels over the  $\pm 10\%$  tolerance range of  $3.3V$  powered systems. The efficient on-chip power supplies require only four small, external  $0.1\mu F$  capacitors for the voltage doubler and inverter functions at  $V_{CC} = 3.3V$ . See the *Capacitor Selection* section, and Table 3 for capacitor recommendations for other operating conditions. The charge pumps operate discontinuously (i.e., they turn off as soon as the  $V_+$  and  $V_-$  supplies are pumped up to the nominal values), resulting in significant power savings.

#### Transmitters

The transmitters are proprietary, low dropout, inverting drivers that translate TTL/CMOS inputs to EIA/TIA-232 output levels. Coupled with the on-chip  $\pm 5.5V$  supplies, these transmitters deliver true RS-232 levels over a wide range of single supply system voltages.

ICL3217E transmitter outputs disable and assume a high impedance state when the device enters the automatic powerdown mode. These outputs may be driven to  $\pm 12V$  when disabled.

Both devices guarantee a 250kbps data rate for full load conditions ( $3k\Omega$  and  $1000pF$ ),  $V_{CC} \geq 3.0V$ , with one transmitter operating at full speed. Under more typical conditions of  $V_{CC} \geq 3.3V$ ,  $R_L = 3k\Omega$ , and  $C_L = 250pF$ , one transmitter easily operates at 800kbps.

Transmitter inputs float if left unconnected, and may cause  $I_{CC}$  increases. Connect unused inputs to GND for the best performance.

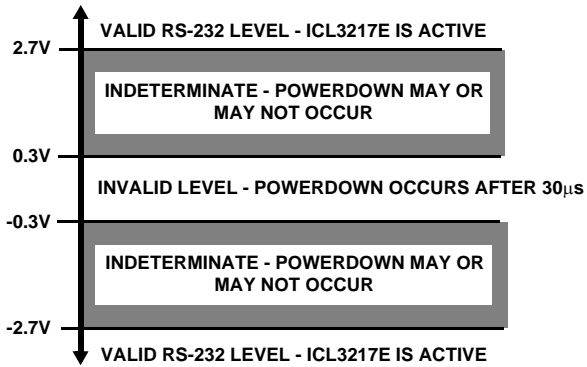

FIGURE 4. DEFINITION OF VALID RS-232 RECEIVER LEVELS

FIGURE 5. AUTOMATIC POWERDOWN TIMING DIAGRAM

This automatic powerdown feature provides additional system power savings without changes to the existing operating system or hardware.

Utilizing power management circuitry, to power down the rest of the communication circuitry (e.g., the UART) when the ICL3217E powers down, produces even greater power savings. Connecting a transition detector to the V- pin (see Figure 3) is an easy way for the power management logic to determine when the ICL3217E enters and exits powerdown.

### Capacitor Selection

The charge pumps require 0.1µF, or greater, capacitors for 3.3V operation. With 0.1µF capacitors, five percent tolerance supplies (e.g., 3.14V minimum) deliver greater than ±5V transmitter swings at full data rate, while ten percent tolerance supplies (e.g., 2.97V minimum) deliver ±4.95V transmitter swings. If greater than ±5V transmitter swings are required with a 10% tolerance 3.3V supply, 0.22µF capacitors are recommended (see Table 3). Existing 5V applications typically utilize either 0.1µF or 1µF capacitors, and the ICL32X7E works well with either value. New 5V designs should use 0.22µF capacitors for the best results. For other supply voltages refer to Table 3 for capacitor values. Do not use values smaller than those listed in Table 3. Increasing the capacitor values (by a factor of two)

reduces ripple on the transmitter outputs and slightly reduces power consumption. C<sub>2</sub>, C<sub>3</sub>, and C<sub>4</sub> can be increased without increasing C<sub>1</sub>'s value, however, do not increase C<sub>1</sub> without also increasing C<sub>2</sub>, C<sub>3</sub>, and C<sub>4</sub> to maintain the proper ratios (C<sub>1</sub> to the other capacitors).

When using minimum required capacitor values, make sure that capacitor values do not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR) usually rises at low temperatures and it influences the amount of ripple on V<sub>+</sub> and V<sub>-</sub>.

TABLE 3. REQUIRED CAPACITOR VALUES

V <sub>CC</sub> (V)	C <sub>1</sub> (µF)	C <sub>2</sub> , C <sub>3</sub> , C <sub>4</sub> (µF)
3.15 to 3.6	0.1	0.1
3.0 to 3.6	0.22	0.22
4.5 to 5.5	0.1 to 1.0	0.1 to 1.0
3.0 to 5.5	0.22	0.22

### Power Supply Decoupling

In most circumstances a 0.1µF bypass capacitor is adequate. In applications that are particularly sensitive to power supply noise, decouple V<sub>CC</sub> to ground with a capacitor of the same value as the charge-pump capacitor C<sub>1</sub>. Connect the bypass capacitor as close as possible to the IC.

### Transmitter Outputs when Exiting Powerdown

Figure 6 shows the response of two ICL3217E transmitter outputs when exiting powerdown mode. As they activate, the two transmitter outputs properly go to opposite RS-232 levels, with no glitching, ringing, nor undesirable transients. Each transmitter is loaded with 3kΩ in parallel with 2500pF. Note that the transmitters enable only when the magnitude of the supplies exceed approximately 3V.

FIGURE 6. TRANSMITTER OUTPUTS WHEN EXITING POWERDOWN (ICL3217E ONLY)

## Operation down to 2.7V

ICL32X7E transmitter outputs meet RS-562 levels ( $\pm 3.7V$ ) with  $V_{CC}$  as low as 2.7V. RS-562 levels typically ensure interoperability with RS-232 devices.

## High Data Rates

The ICL32XX maintain the RS-232  $\pm 5V$  minimum transmitter output voltages even at high data rates. Figure 7 details a transmitter loopback test circuit, and Figure 8 illustrates the loopback test result at 120kbps. For this test, all transmitters were simultaneously driving RS-232 loads in parallel with 1000pF, at 120kbps. Figure 9 shows the loopback results for a single transmitter driving 1000pF and an RS-232 load at 250kbps. The static transmitters were also loaded with an RS-232 receiver.

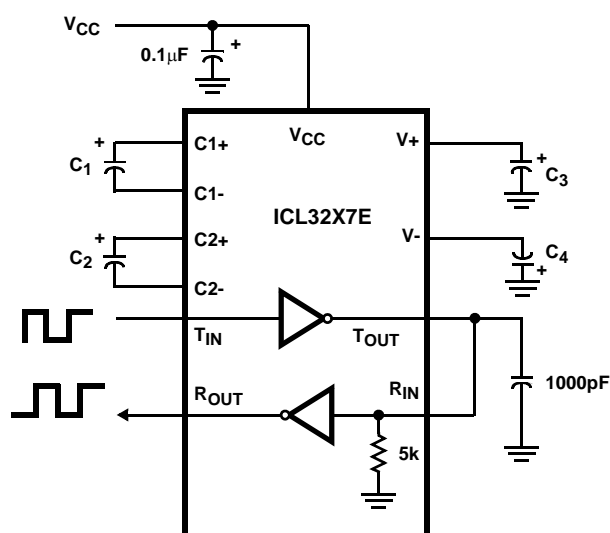

FIGURE 7. TRANSMITTER LOOPBACK TEST CIRCUIT

FIGURE 8. LOOPBACK TEST AT 120kbps

FIGURE 9. LOOPBACK TEST AT 250kbps

## Interconnection with 3V and 5V Logic

The ICL32X7E directly interface with 5V CMOS and TTL logic families. Nevertheless, with the ICL32X7E at 3.3V, and the logic supply at 5V, AC, HC, and CD4000 outputs can drive ICL32X7E inputs, but ICL32X7E outputs do not reach the minimum  $V_{IH}$  for these logic families. See Table 4 for more information.

TABLE 4. LOGIC FAMILY COMPATIBILITY WITH VARIOUS SUPPLY VOLTAGES

SYSTEM POWER-SUPPLY VOLTAGE (V)	$V_{CC}$ SUPPLY VOLTAGE (V)	COMPATIBILITY
3.3	3.3	Compatible with all CMOS families.
5	5	Compatible with all TTL and CMOS logic families.
5	3.3	Compatible with ACT and HCT CMOS, and with TTL. ICL32X7E outputs are incompatible with AC, HC, and CD4000 CMOS inputs.

## $\pm 15kV$ ESD Protection

All pins on ICL32XX devices include ESD protection structures, but the ICL32X7E incorporate advanced structures which allow the RS-232 pins (transmitter outputs and receiver inputs) to survive ESD events up to  $\pm 15kV$ . The RS-232 pins are particularly vulnerable to ESD damage because they typically connect to an exposed port on the exterior of the finished product. Simply touching the port pins, or connecting a cable, can cause an ESD event that might destroy unprotected ICs. These new ESD structures protect the device whether or not it is powered up, protect without allowing any latchup mechanism to activate, and don't interfere with RS-232 signals as large as  $\pm 25V$ .

### Human Body Model (HBM) Testing

As the name implies, this test method emulates the ESD event delivered to an IC during human handling. The tester delivers the charge through a 1.5k $\Omega$  current limiting resistor, making the test less severe than the IEC61000 test which utilizes a 330 $\Omega$  limiting resistor. The HBM method determines an IC's ability to withstand the ESD transients typically present during handling and manufacturing. Due to the random nature of these events, each pin is tested with respect to all other pins. The RS-232 pins on "E" family devices can withstand HBM ESD events to  $\pm 15$ kV.

### IEC61000-4-2 Testing

The IEC61000 test method applies to finished equipment, rather than to an individual IC. Therefore, the pins most likely to suffer an ESD event are those that are exposed to the outside world (the RS-232 pins in this case), and the IC is tested in its typical application configuration (power applied) rather than testing each pin-to-pin combination. The lower current limiting resistor coupled with the larger charge storage capacitor yields a test that is much more severe than

the HBM test. The extra ESD protection built into this device's RS-232 pins allows the design of equipment meeting level 4 criteria without the need for additional board level protection on the RS-232 port.

### AIR-GAP DISCHARGE TEST METHOD

For this test method, a charged probe tip moves toward the IC pin until the voltage arcs to it. The current waveform delivered to the IC pin depends on approach speed, humidity, temperature, etc., so it is difficult to obtain repeatable results. The "E" device RS-232 pins withstand  $\pm 15$ kV air-gap discharges.

### CONTACT DISCHARGE TEST METHOD

During the contact discharge test, the probe contacts the tested pin before the probe tip is energized, thereby eliminating the variables associated with the air-gap discharge. The result is a more repeatable and predictable test, but equipment limits prevent testing devices at voltages higher than  $\pm 8$ kV. All "E" family devices survive  $\pm 8$ kV contact discharges on the RS-232 pins.

All Intersil semiconductor products are manufactured, assembled and tested under **ISO9000** quality systems certification.

Intersil semiconductor products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.

For information regarding Intersil Corporation and its products, see web site **www.intersil.com**
