

## 2.1A, 30V, 0.150 Ohm, P-Channel Logic Level, Power MOSFET

This product is a P-Channel power MOSFET manufactured using the MegaFET process. This process, which uses feature sizes approaching those of LSI circuits, gives optimum utilization of silicon, resulting in outstanding performance. It was designed for use in applications such as switching regulators, switching converters, motor drivers, and relay drivers. This transistor can be operated directly from integrated circuits.

Formerly developmental type TA49222.

### Ordering Information

PART NUMBER	PACKAGE	BRAND
RFT2P03L	SOT-223	2P03L

NOTE: RFT2P03L is available only in tape and reel. Use the entire part number and add the suffix T.

### Features

- 2.1A, 30V
- $r_{DS(ON)} = 0.150\Omega$
- Temperature Compensating PSPICE® Model
- Thermal Impedance SPICE Model
- Peak Current vs Pulse Width Curve
- UIS Rating Curve
- Related Literature
  - TB334, "Guidelines for Soldering Surface Mount Components to PC Boards"

### Symbol

### Packaging

**SOT-223**

**Absolute Maximum Ratings**  $T_A = 25^{\circ}\text{C}$ , Unless Otherwise Specified

			UNITS
Drain to Source Voltage (Note 1) . . . . .	$V_{DSS}$	-30	V

### Thermal Resistance vs. Mounting Pad Area

The maximum rated junction temperature,  $T_{JM}$ , and the thermal resistance of the heat dissipating path determines the maximum allowable device power dissipation,  $P_{DM}$ , in an application. Therefore the application's ambient temperature,  $T_A$  ( $^{\circ}\text{C}$ ), and thermal impedance  $R_{\theta JA}$  ( $^{\circ}\text{C/W}$ ) must be reviewed to ensure that  $T_{JM}$  is never exceeded. Equation 1 mathematically represents the relationship and serves as the basis for establishing the rating of the part.

$$P_{DM} = \frac{(T_{JM} - T_A)}{R_{\theta JA}} \quad (\text{EQ. 1})$$

In using surface mount devices such as the SOT-223 package, the environment in which it is applied will have a significant influence on the part's current and maximum power dissipation ratings. Precise determination of the  $P_{DM}$  is complex and influenced by many factors:

1. Mounting pad area onto which the device is attached and whether there is copper on one side or both sides of the board
2. The number of copper layers and the thickness of the board
3. The use of external heat sinks
4. The use of thermal vias
5. Air flow and board orientation
6. For non steady state applications, the pulse width, the duty cycle and the transient thermal response of the part, the board and the environment they are in.

Intersil provides thermal information to assist the designer's preliminary application evaluation. Figure 20 defines the  $R_{\theta JA}$  for the device as a function of the top copper (component side) area. This is for a horizontally positioned FR-4 board with 1oz copper after 1000 seconds of steady state power with no air flow. This graph provides the

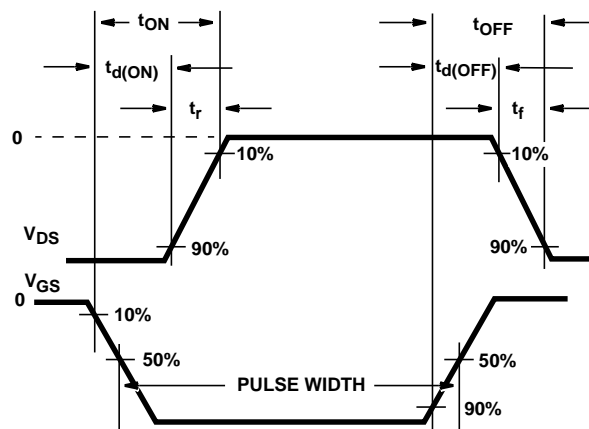

FIGURE 19. RESISTIVE SWITCHING WAVEFORMS

necessary information for calculation of the steady state junction temperature or power dissipation. Pulse applications can be evaluated using the Intersil device Spice thermal model or manually utilizing the normalized maximum transient thermal impedance curve.

FIGURE 20. THERMAL RESISTANCE vs MOUNTING PAD AREA

Displayed on the curve are  $R_{\theta JA}$  values listed in the Electrical Specifications table. The points were chosen to depict the compromise between the copper board area, the thermal resistance and ultimately the power dissipation,  $P_{DM}$ . Thermal resistances corresponding to other component side copper areas can be obtained from Figure 20 or by calculation using Equation 2. The area, in square inches is the top copper area including the gate and source pads.

$$R_{\theta JA} = 75.9 - 19.3 \times \ln(\text{Area}) \quad (\text{EQ. 2})$$
