

Micropower, Single Supply, Precision Op Amp

FEATURES

- 60 μ A Max Supply Current
- 40 μ V Max Offset Voltage
- 350pA Max Offset Current
- 0.5 μ V_{P-P} 0.1Hz to 10Hz Voltage Noise
- 2.5pA_{P-P} 0.1Hz to 10Hz Current Noise
- 0.4 μ V/ $^{\circ}$ C Offset Voltage Drift
- 250kHz Gain-Bandwidth Product
- 0.12V/ μ s Slew Rate
- Single Supply Operation
 - Input Voltage Range Includes Ground
 - Output Swings to Ground while Sinking Current
 - No Pull-Down Resistors are Needed
- Output Sources and Sinks 5mA Load Current

APPLICATIONS

- Replaces OP-07, OP-77, AD707, LT1001, LT1012 at 10 to 60 Times Lower Power
- Battery or Solar Powered Systems
- 4mA to 20mA Current Loops
- Two Terminal Current Source
- Megaohm Source Resistance Difference Amplifier

 LTC and LT are registered trademarks of Linear Technology Corporation.

DESCRIPTION

The LT[®]1077 is a micropower precision operational amplifier optimized for single supply operation at 5V. In addition, ± 15 V specifications are provided.

Micropower performance of competing devices is achieved at the expense of seriously degrading precision, noise, speed, and output drive specifications. The LT1077 reduces supply current without sacrificing other parameters. The offset voltage achieved is the lowest of any micropower op amp. Offset current, voltage and current noise, slew rate and gain-bandwidth product are all two to ten times better than on previous micropower op amps.

The 1/f corner of the voltage noise spectrum is at 0.7Hz. This results in low frequency (0.1Hz to 10Hz) noise performance which can only be found on devices with an order of magnitude higher supply current.

The LT1077 is completely plug-in compatible (including nulling) with all industry standard precision op amps. Thus, it can replace these precision op amps in many applications without sacrificing performance, yet with significant power savings.

The LT1077 can be operated from one lithium cell or two Ni-Cad batteries. The input range goes below ground. The all-NPN output stage swings to ground while sinking current—no pull-down resistors are needed.

For dual and quad op amps with similar specifications please see the LT1078/LT1079 datasheet.

TYPICAL APPLICATION

1077fa

ABSOLUTE MAXIMUM RATINGS (Note 1)

Supply Voltage $\pm 22V$
 Differential Input Voltage $\pm 30V$
 Input Voltage Equal to Positive Supply Voltage
 Input Voltage 5V Below Negative Supply Voltage
 Output Short-Circuit Duration Indefinite

Operating Temperature Range

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: Slew rate at 5V , 0V is guaranteed by inference from the slew rate measurement at $\pm 15\text{V}$.

Note 3: This parameter is tested on a sample basis only. All noise parameters are tested with $V_S = \pm 2.5\text{V}$, $V_O = 0\text{V}$.

Note 4: This parameter is guaranteed by design and is not tested.

Note 5: Power supply rejection ratio is measured at the minimum supply voltage. The op amps actually work at 1.8V supply but with a typical offset skew of $-300\mu\text{V}$.

Note 6: This parameter is not 100% tested.

APPLICATIONS INFORMATION

The LT1077 is fully specified with $V^+ = 5\text{V}$, $V^- = 0\text{V}$, $V_{\text{CM}} = 0.1\text{V}$. This set of operating conditions appears to be the most representative for battery powered micropower circuits. Offset voltage is internally trimmed to a minimum value at these supply voltages. When 9V or 3V batteries, or $\pm 2.5\text{V}$ dual supplies are used, bias and offset current changes will be minimal. Offset voltage changes will be just a few microvolts as given by the PSRR and CMRR specifications. For example, if $\text{PSRR} = 114\text{dB}$ ($= 2\mu\text{V/V}$), at 9V the offset voltage change will be $8\mu\text{V}$. Similarly, $V_S \pm 2.5\text{V}$, $V_{\text{CM}} = 0$ is equivalent to a common mode voltage change of 2.4V or a V_{OS} change of $7\mu\text{V}$ if $\text{CMRR} = 110\text{dB}$ ($3\mu\text{V/V}$).

A full set of specifications is also provided at $\pm 15\text{V}$ supply voltages for comparison with other devices and for completeness.

The LT1077 is pin compatible to, and directly replaces, such precision op amps as the OP-07, OP-77, AD707 and LT1001 with 30 to 60 times savings in supply current. The LT1077 is also a direct plug-in replacement for LT1012 and OP-97 devices with 10 times lower dissipation. Compatibility includes externally nulling the offset voltage, as all of the devices above are trimmed with a potentiometer between Pins 1 and 8 and the wiper tied to V^+ .

The LT1077 replaces and upgrades such micropower op amps as the OP-20, LM4250, and OP-90, provided that the external nulling circuitry (and set resistor in the case of the LM4250) are removed. Since the offset voltage of the LT1077 is extremely low, nulling will be unnecessary in most applications.

Single Supply Operation

The LT1077 is fully specified for single supply operation, (i.e., when the negative supply is 0V). Input common mode range goes below ground and the output swings within a few millivolts of ground while sinking current. All competing micropower op amps either cannot swing to within 600mV of ground (OP-20, OP-220, OP-420) or need a pull-down resistor connected to the output to swing to ground (OP-90, OP-290, OP-490, HA5141/42/44). This difference is critical because in many applications these competing devices cannot be operated as micropower op amps and swing to ground simultaneously.

Consider the difference amplifiers shown in Typical Applications as an example. When the common mode signal is high and the output low, the amplifier has to sink current. In the gain of 10 circuit, the competing devices require a $30\text{k}\Omega$ pull-down resistor at the output to handle the specified signals. (The LT1077 does not need pull-down

APPLICATIONS INFORMATION

resistors.) When the output is high the pull-down resistor draws $80\mu\text{A}$ which dominates the micropower current budget. This situation is much worse in the gain of one circuit with $V^- = 0\text{V}$. At 100V common mode, the output has to sink $2\mu\text{A}$. At a minimum output voltage of 20mV competing devices require a 10k pull-down resistor. As the output now swings to 10V , this resistor draws 1mA of current.

Since the output of the LT1077 cannot go exactly to ground, but can only approach ground to within a few millivolts, care should be exercised to ensure that the output is not saturated. For example, a 1mV input signal will cause the amplifier to set up in its linear region in the gain 100 configuration shown below; however, it is not enough to make the amplifier function properly in the voltage follower mode.

Single supply operation can also create difficulties at the input. The driving signal can fall below 0V —inadvertently or on a transient basis. If the input is more than a few hundred millivolts below ground, two distinct problems can occur on previous single supply designs, such as the LM124, LM158, OP-20, OP-21, OP-220, OP-221, OP-420 (a and b), OP-90/290/490 (b only):

a) When the input is more than a diode drop below ground, unlimited current will flow from the substrate (V^- terminal) to the input (this can destroy the unit). On the LT1077, resistors in series with the input protect the device even when the input is 5V below ground.

b) When the input is more than 400mV below ground (at 25°C), the input stage saturates and phase reversal occurs at the output (this can cause lock-up in servo systems). Due to a unique phase reversal protection circuitry, the LT1077's output does not reverse, as illustrated below, even when the input is at -1.0V .

Voltage Follower with Input Exceeding the Negative Common Mode Range ($V_S = 5\text{V}$, 0V)

APPLICATIONS INFORMATION

Comparator Applications

The single supply operation of the LT1077 and its ability to swing close to ground while sinking current,

lends itself to use as a precision comparator with TTL compatible output.

**Comparator Rise Response Time
to 10mV, 5mV, 2mV Overdrive**

**Comparator Fall Response Time
to 10mV, 5mV, 2mV Overdrive**

TYPICAL APPLICATIONS

**Megaohm Input Impedance
Gain of 10 Difference Amplifier**

BANDWIDTH = 20KHZ
 OUTPUT OFFSET = 0.7mV
 OUTPUT NOISE = 80µV_{P-P} (0.1Hz TO 10Hz)
 260µV_{RMS} OVER FULL BANDWIDTH
 SUPPLY CURRENT = 45µA

THE USEFULNESS OF DIFFERENCE AMPLIFIERS IS LIMITED BY THE FACT THAT THE INPUT RESISTANCE IS EQUAL TO THE SOURCE RESISTANCE. THE PICO-AMPERE OFFSET CURRENT AND LOW CURRENT NOISE OF THE LT1077 ALLOWS THE USE OF 1M SOURCE RESISTORS WITHOUT DEGRADATION IN PERFORMANCE. IN ADDITION, WITH MEGA OHM RESISTORS MICROPPOWER OPERATION CAN BE MAINTAINED

$$= \frac{1.230V}{R_1} + 50\mu A$$

Diagram of an LT1077 op-amp circuit. The op-amp is configured as a voltage follower with a feedback resistor of 2M. The input is a sine wave with an amplitude of 1.8V. The output is a sine wave with an amplitude of 1.8V. The op-amp is powered by a 3V supply. The text indicates $V_{0MIN} = 6mV$ and NO DISTORTION TO 100Hz.

SIMPLIFIED SCHEMATIC

LT1077-S01

PACKAGE DESCRIPTION

H Package 8-Lead TO-5 Metal Can (.200 Inch PCD) (Reference LTC DWG # 05-08-1320)

J8 Package 8-Lead Cerdip (Narrow .300 Inch, Hermetic) (Reference LTC DWG # 05-08-1110)

OBSOLETE PACKAGES

PACKAGE DESCRIPTION

N8 Package 8-Lead PDIP (Narrow .300 Inch) (Reference LTC DWG # 05-08-1510)

NOTE:

1. DIMENSIONS ARE $\frac{\text{INCHES}}{\text{MILLIMETERS}}$

*THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .010 INCH (0.254mm)

PACKAGE DESCRIPTION

S8 Package 8-Lead Plastic Small Outline (Narrow .150 Inch) (Reference LTC DWG # 05-08-1610)
