

FEATURES

- **Gain-Bandwidth: 500MHz**
- **Gain of 10 Stable Uncompensated**
- **Slew Rate: 200V/ μs**
- Input Noise Voltage: $3\text{nV}/\sqrt{\text{Hz}}$
- C-Load™ Op Amp Drives Capacitive Loads
- External Compensation Pin
- Maximum Input Offset Voltage: 300 μV
- Maximum Input Bias Current: 300nA
- Maximum Input Offset Current: 300nA
- Minimum Output Swing Into 500 Ω : $\pm 12\text{V}$
- Minimum DC Gain: 100V/mV, $R_L = 500\Omega$
- Settling Time to 0.1%: 75ns, 10V Step
- Settling Time to 0.01%: 120ns, 10V Step
- Differential Gain: 0.4%, $A_V = 2$, $R_L = 150\Omega$
- Differential Phase: 0.1°, $A_V = 2$, $R_L = 150\Omega$

APPLICATIONS

- Wideband Amplifiers
- Buffers
- Active Filters
- Video and RF Amplification
- Cable Drivers
- 8-, 10-, 12-Bit Data Acquisition Systems

DESCRIPTION

The LT1222 is a low noise, very high speed operational amplifier with superior DC performance. The LT1222 is stable in a noise gain of 10 or greater without compensation, or the part can be externally compensated for lower closed-loop gain at the expense of lower bandwidth and slew rate. It features reduced input offset voltage, lower input bias currents, lower noise and higher DC gain than devices with comparable bandwidth and slew rate. The circuit is a single gain stage that includes proprietary DC gain enhancement circuitry to obtain precision with high speed. The high gain and fast settling time make the circuit an ideal choice for data acquisition systems. The circuit is also capable of driving capacitive loads which makes it useful in buffer or cable driver applications. The compensation node can also be used to clamp the output swing.

The LT1222 is a member of a family of fast, high performance amplifiers that employ Linear Technology Corporation's advanced complementary bipolar processing. For unity-gain stable applications the LT1220 can be used, and for gains of 4 or greater the LT1221 can be used.

LT and **LTC** are registered trademarks and **LT** is a trademark of Linear Technology Corporation. C-Load is a trademark of Linear Technology Corporation.

TYPICAL APPLICATION

$A_V = 10$ with Output Clamping

LT1222 • TA01

$A_V = -1$, $C_C = 30\text{pF}$ Pulse Response

$R_F = R_G = 1\text{k}$
 $V_{IN} = 100\text{mV}$
 $V_S = \pm 15\text{V}$
 $f = 5\text{MHz}$

LT1222 • TA02

ABSOLUTE MAXIMUM RATINGS

Total Supply Voltage (V^+ to V^-)	36V
Differential Input Voltage	$\pm 6V$
Input Voltage	$\pm V_S$

The ● denotes specifications which apply over the full temperature range.

Note 1: A heat sink may be required when the output is shorted indefinitely.

Note 2: Commercial parts are designed to operate over $-40^\circ C$ to $85^\circ C$, but are not tested nor guaranteed beyond $0^\circ C$ to $70^\circ C$. Industrial grade parts specified and tested over $-40^\circ C$ to $85^\circ C$ are available on special request. Consult factory.

Note 3: Input offset voltage is pulse tested and is exclusive of warm-up drift.

Note 4: Slew rate is measured between $\pm 10V$ on an output swing of $\pm 12V$.

Note 5: $FPBW = SR/2\pi V_P$.

Note 6: Differential Gain and Phase are tested with five amps in series. Attenuators of $1/Gain$ are used as loads.

APPLICATIONS INFORMATION

The LT1222 is stable in noise gains of 10 or greater and may be inserted directly into HA2520/2/5, HA2541/2/4, AD817, AD847, EL2020, EL2044 and LM6361 applications, provided that the nulling circuitry is removed and the amplifier configuration has a high enough noise gain. The suggested nulling circuit for the LT1222 is shown in the following figure.

Layout and Passive Components

The LT1222 amplifier is easy to apply and tolerant of less than ideal layouts. For maximum performance (for example, fast settling time) use a ground plane, short lead lengths and RF-quality bypass capacitors (0.01μF to 0.1μF). For high drive current applications use low ESR bypass capacitors (1μF to 10μF tantalum). Sockets should be avoided when maximum frequency performance is required. For more details see Design Note 50. Feedback resistors greater than 5k are not recommended because a pole is formed with the input capacitance which can cause peaking or oscillations. Stray capacitance on pin 5 should be minimized. Bias current cancellation circuitry is employed on the inputs of the LT1222 so the input bias current and input offset current have identical specifications. For this reason, matching the impedance on the inputs to reduce bias current errors is not necessary.

APPLICATIONS INFORMATION

Output Clamping

Access to the internal compensation node at pin 5 allows the output swing of the LT1222 to be clamped. An example is shown on the first page of this data sheet. The compensation node is approximately one diode drop above the output and can source or sink 1.2mA. Back-to-back Schottky diodes clamp pin 5 to a diode drop above ground so the output is clamped to $\pm 0.5V$ (the drop of the Schottkys at 1.2mA). The diode reference is bypassed for good AC response. This circuit is useful for amplifying the voltage at false sum nodes used in settling time measurements.

Capacitive Loading

The LT1222 is stable with capacitive loads. This is accomplished by sensing the load induced output pole and adding compensation at the amplifier gain node. As the capacitive load increases, both the bandwidth and phase margin decrease. There will be peaking in the frequency domain as shown in the curve of Frequency Response vs Capacitive Load. The small-signal transient response will have more overshoot as shown in the photo of the small-signal response with 1000pF load. The large-signal response with a 10,000pF load shows the output slew rate being limited to 4V/ μ s by the short-circuit current. The LT1222 can drive coaxial cable directly, but for best pulse fidelity a resistor of value equal to the characteristic impedance of the cable (i.e., 75 Ω) should be placed in series with the output. The other end of the cable should be terminated with the same value resistor to ground.

Compensation

The LT1222 has a typical gain-bandwidth product of 500MHz which allows it to have wide bandwidth in high gain configurations (i.e., in a gain of 100, it will have a bandwidth of about 5MHz). For added flexibility the amplifier frequency response may be adjusted by adding capacitance from pin 5 to ground. The compensation capacitor

may be used to reduce overshoot, to allow the amplifier to be used in lower noise gains, or simply to reduce bandwidth. Table 1 shows gain and compensation capacitor versus $-3dB$ bandwidth, maximum frequency peaking and small-signal overshoot.

Table 1

A_V	C_C (pF)	f_{-3dB} (MHz)	Max Peaking (dB)	Overshoot (%)
-1	30	99	4.2	36
-1	50	70	0.9	13
-1	82	32	0	0
-1	150	13	0	0
5	10	140	3.8	35
5	20	100	0	5
5	30	34	0	1
5	50	15	0	0
10	0	150	9.5	45
10	5	111	0.2	10
10	10	40	0	2
10	20	17	0	0
20	0	82	0.1	10
20	5	24	0	0
20	10	14	0	0

For frequencies < 10MHz the frequency response of the amplifier is approximately:

$$f = 1/[2\pi \times 53\Omega \times (C_C + 6pF) \times (\text{Noise Gain})]$$

The slew rate is affected as follows:

$$SR = 1.2mA/(C_C + 6pF)$$

An example would be a gain of -10 (noise gain of 11) and $C_C = 20pF$ which has 10.5MHz bandwidth and 46V/ μ s slew rate. It should be noted that the LT1222 is not stable in $A_V = 1$ unless $C_C = 50pF$ and a 1k resistor is used as the feedback resistor. The 1k and input capacitance increase the noise gain at frequency to aid stability.
