

## FEATURES

- 100MHz Gain Bandwidth
- 750V/ $\mu$ s Slew Rate
- 3.6mA Maximum Supply Current per Amplifier
- 8nV/ $\sqrt{\text{Hz}}$  Input Noise Voltage
- Unity-Gain Stable
- 1.5mV Maximum Input Offset Voltage
- 4 $\mu$ A Maximum Input Bias Current
- 400nA Maximum Input Offset Current
- 40mA Minimum Output Current,  $V_{OUT} = \pm 3\text{V}$
- $\pm 3.5\text{V}$  Minimum Input CMR,  $V_S = \pm 5\text{V}$
- Specified at  $\pm 5\text{V}$ , Single 5V
- Available in MS8 and SO-8 Packages

## APPLICATIONS

- Wideband Amplifiers
- Buffers
- Active Filters
- Video and RF Amplification
- Cable Drivers
- Data Acquisition Systems

## DESCRIPTION

The LT<sup>®</sup>1813 is a low power, high speed, very high slew rate operational amplifier with excellent DC performance. The LT1813 features reduced supply current, lower input offset voltage, lower input bias current and higher DC gain than other devices with comparable bandwidth. The circuit topology is a voltage feedback amplifier with the slewing characteristics of a current feedback amplifier.

The output drives a 100 $\Omega$  load to  $\pm 3.5\text{V}$  with  $\pm 5\text{V}$  supplies. On a single 5V supply, the output swings from 1.1V to 3.9V with a 100 $\Omega$  load connected to 2.5V. The amplifier is stable with a 1000pF capacitive load which makes it useful in buffer and cable driver applications.

The LT1813 is manufactured on Linear Technology's advanced low voltage complementary bipolar process. For higher supply voltage single, dual and quad operational amplifiers with up to 70MHz gain bandwidth, see the LT1351 through LT1365 data sheets.

 LTC and LT are registered trademarks of Linear Technology Corporation.

## TYPICAL APPLICATION

4MHz, 4th Order Butterworth Filter

Filter Frequency Response

1813 TA02

**ABSOLUTE MAXIMUM RATINGS** (Note 1)

Total Supply Voltage ( $V^+$  to  $V^-$ ) ..... 12.6V  
 Differential Input Voltage (Transient Only, Note 2) ...  $\pm 3V$   
 Input Voltage .....  $\pm V_S$   
 Output Short-Circuit Duration (Note 3) ..... Indefinite  
 Operating Temperature Range .....  $-40^\circ\text{C}$  to  $85^\circ\text{C}$

Specified Temperature Range  
 (Notes 8, 9) .....  $-40^\circ\text{C}$  to  $85^\circ\text{C}$   
 Maximum Junction Temperature .....  $150^\circ\text{C}$   
 Storage Temperature Range .....  $-65^\circ\text{C}$  to  $150^\circ\text{C}$   
 Lead Temperature (Soldering, 10 sec) .....  $300^\circ\text{C}$

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** Differential inputs of  $\pm 3\text{V}$  are appropriate for transient operation only, such as during slewing. Large sustained differential inputs can cause excessive power dissipation and may damage the part.

**Note 3:** A heat sink may be required to keep the junction temperature below absolute maximum when the output is shorted indefinitely.

**Note 4:** Input offset voltage is pulse tested and is exclusive of warm-up drift.

**Note 5:** Slew rate is measured between  $\pm 2\text{V}$  on the output with  $\pm 3\text{V}$  input for  $\pm 5\text{V}$  supplies and  $2V_{P-P}$  on the output with a  $3V_{P-P}$  input for single 5V supplies.

**Note 6:** Full power bandwidth is calculated from the slew rate:

$$\text{FPBW} = \text{SR}/2\pi V_P.$$

**Note 7:** This parameter is not 100% tested.

**Note 8:** The LT1813C is guaranteed to meet specified performance from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$  and is designed, characterized and expected to meet these extended temperature limits, but is not tested at  $-40^{\circ}\text{C}$  and  $85^{\circ}\text{C}$ . The LT1813I is guaranteed to meet the extended temperature limits.

**Note 9:** The LT1813D is 100% production tested at  $25^{\circ}\text{C}$ . It is designed, characterized and expected to meet the  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$  specifications although it is not tested or QA sampled at these temperatures. The LT1813D is guaranteed functional from  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  but may not meet those specifications.

## APPLICATIONS INFORMATION

### Layout and Passive Components

The LT1813 amplifier is more tolerant of less than ideal layouts than other high speed amplifiers. For maximum performance (for example, fast settling) use a ground plane, short lead lengths and RF-quality bypass capacitors (0.01 $\mu$ F to 0.1 $\mu$ F). For high drive current applications, use low ESR bypass capacitors (1 $\mu$ F to 10 $\mu$ F tantalum).

The parallel combination of the feedback resistor and gain setting resistor on the inverting input combine with the input capacitance to form a pole that can cause peaking or oscillations. If feedback resistors greater than 2k are used, a parallel capacitor of value

$$C_F > R_G \cdot C_{IN}/R_F$$

should be used to cancel the input pole and optimize dynamic performance. For applications where the DC noise gain is 1 and a large feedback resistor is used,  $C_F$  should be greater than or equal to  $C_{IN}$ . An example would be an I-to-V converter.

### Input Considerations

Each of the LT1813 amplifier inputs is the base of an NPN and PNP transistor whose base currents are of opposite polarity and provide first-order bias current cancellation. Because of variation in the matching of NPN and PNP beta, the polarity of the input current can be positive or negative. The offset current does not depend on beta matching and is well controlled. The use of balanced source resistance at each input is recommended for applications where DC accuracy must be maximized. The inputs can withstand differential input voltages of up to 3V without damage and need no clamping or source resistance for protection. Differential inputs generate the large supply currents (up to 40mA) required for high slew rates. Typically, power dissipation does not significantly increase in normal, closed-loop operation because of the low duty cycle of the transient inputs.

**The device should not be used as a comparator** because with sustained differential inputs, excessive power dissipation may result.

### Capacitive Loading

The LT1813 is stable with a 1000pF capacitive load which is outstanding for a 100MHz amplifier. This is accomplished by sensing the load induced output pole and adding compensation at the amplifier gain node. As the capacitive load increases, both the bandwidth and phase margin decrease so there will be peaking in the frequency domain and in the transient response. Coaxial cable can be driven directly, but for best pulse fidelity, a resistor of value equal to the characteristic impedance of the cable (i.e., 75 $\Omega$ ) should be placed in series with the output. The other end of the cable should be terminated with the same value resistor to ground.

### Slew Rate

The slew rate is proportional to the differential input voltage. Highest slew rates are therefore seen in the lowest gain configurations. For example, a 5V output step in a gain of 10 has a 0.5V input step, whereas in unity gain there is a 5V input step. The LT1813 is tested for slew rate in a gain of -1. Lower slew rates occur in higher gain configurations.

### Power Dissipation

The LT1813 combines high speed and large output drive in a small package. It is possible to exceed the maximum junction temperature under certain conditions. Maximum junction temperature ( $T_J$ ) is calculated from the ambient temperature ( $T_A$ ) and power dissipation ( $P_D$ ) as follows:

$$\text{LT1813CS8: } T_J = T_A + (P_D \cdot 150^\circ\text{C/W})$$

Power dissipation is composed of two parts. The first is due to the quiescent supply current and the second is due to on-chip dissipation caused by the load current.

The worst-case load induced power occurs when the output voltage is at 1/2 of either supply voltage (or the maximum swing if less than 1/2 supply voltage). For each amplifier:

$$P_{D\text{MAX}} = (V^+ - V^-)(I_{S\text{MAX}}) + (V^+/2)^2/R_L \text{ or}$$

$$P_{D\text{MAX}} = (V^+ - V^-)(I_{S\text{MAX}}) + (V^+ - V_{O\text{MAX}})(V_{O\text{MAX}}/R_L)$$

## APPLICATIONS INFORMATION

Example: LT1813 in SO-8 at 70°C,  $V_S = \pm 5V$ ,  $R_L = 100\Omega$

$$P_{D\text{MAX}} = (10V)(4.5mA) + (2.5V)^2/100\Omega = 108mW$$

$$T_{J\text{MAX}} = 70^\circ\text{C} + (2 \cdot 108mW)(150^\circ\text{C/W}) = 102^\circ\text{C}$$

### Circuit Operation

The LT1813 circuit topology is a true voltage feedback amplifier that has the slewing behavior of a current feedback amplifier. The operation of the circuit can be understood by referring to the Simplified Schematic. The inputs are buffered by complementary NPN and PNP emitter followers which drive a 300Ω resistor. The input voltage appears across the resistor generating currents that are mirrored into the high impedance node.

Complementary followers form an output stage that buffers the gain node from the load. The bandwidth is set by the input resistor and the capacitance on the high impedance node. The slew rate is determined by the current available to charge the gain node capacitance. This current

is the differential input voltage divided by  $R_1$ , so the slew rate is proportional to the input. Highest slew rates are therefore seen in the lowest gain configurations.

The RC network across the output stage is bootstrapped when the amplifier is driving a light or moderate load and has no effect under normal operation. When driving capacitive loads (or a low value resistive load) the network is incompletely bootstrapped and adds to the compensation at the high impedance node. The added capacitance slows down the amplifier which improves the phase margin by moving the unity-gain cross away from the pole formed by the output impedance and the capacitive load. The zero created by the RC combination adds phase to ensure that the total phase lag does not exceed 180 degrees (zero phase margin) and the amplifier remains stable. In this way, the LT1813 is stable with up to 1000pF capacitive loads in unity gain, and even higher capacitive loads in higher closed-loop gain configurations.

## SIMPLIFIED SCHEMATIC

## TYPICAL APPLICATION

Two Op Amp Instrumentation Amplifier

$$\text{GAIN} = \left[ \frac{R_4}{R_3} \right] \left[ 1 + \left( \frac{1}{2} \right) \left( \frac{R_2}{R_1} + \frac{R_3}{R_4} \right) + \frac{(R_2 + R_3)}{R_5} \right] = 102$$

TRIM R5 FOR GAIN  
TRIM R1 FOR COMMON MODE REJECTION  
BW = 1MHz

1813 TA03

## PACKAGE DESCRIPTION

**MS8 Package**  
**8-Lead Plastic MSOP**  
(LTC DWG # 05-08-1660)

\* DIMENSION DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH, PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE

\*\* DIMENSION DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSIONS. INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE

**S8 Package**  
**8-Lead Plastic Small Outline (Narrow 0.150)**  
(LTC DWG # 05-08-1610)

\* DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE

\*\* DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED 0.010" (0.254mm) PER SIDE

S08 1298
