DESCRIPTION

The LTC[®]2050 is a low drift operational amplifier available in the 5- or 6-lead SOT-23 and SO-8 packages. It operates from a single 2.7V supply while still supporting 5V applications. The power consumption is $800\mu\text{A}$ and the versions in the 6-lead SOT-23 and SO-8 packages offer power shutdown (active low).

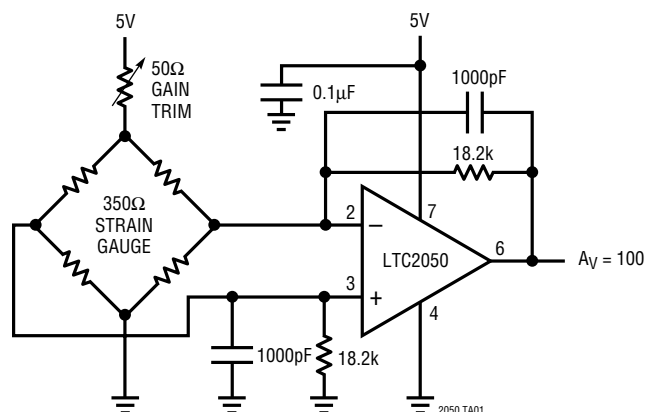

The LTC2050, despite its miniature size, features uncompromising DC performance. The typical input offset voltage and offset drift are $0.5\mu\text{V}$ and $10\text{nV}/^\circ\text{C}$. The almost zero DC offset and drift are supported with a power supply rejection ratio (PSRR) and common mode rejection ratio (CMRR) of more than 130dB.

The input common mode voltage ranges from the negative supply up to 1V from the positive supply. The LTC2050 also has an enhanced output stage capable of driving loads as low as $1\text{k}\Omega$ to both supply rails. The open-loop gain, loaded with $1\text{k}\Omega$, is in excess of 140dB. The LTC2050 also features a $1.5\mu\text{V}_{\text{P-P}}$ DC to 10Hz noise and a 3MHz gain bandwidth product.

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

Note 2: These parameters are guaranteed by design. Thermocouple effects preclude measurements of these voltage levels during automated testing.

Note 3: The LTC2050C is guaranteed to meet specified performance from 0°C to 70°C and is designed, characterized and expected to meet these extended temperature limits, but is not tested at -40°C and 85°C . The LTC2050I is guaranteed to meet the extended temperature limits.
