

3.3V/5V or Adjustable, Step-Up/Down DC-DC Converters

MAX710/MAX711

General Description

The MAX710/MAX711 integrate a step-up DC-DC converter with a linear regulator to provide step-up/down voltage conversion. They are optimized for battery applications where the input varies above and below the regulated output voltage. They have an input range from +1.8V to +11V. Typical efficiency when boosting battery inputs is 85%.

The MAX710/MAX711 can be configured for minimum noise or optimum efficiency. Shutdown control turns off the part completely, disconnecting the input from the output ($I_{SHDN} = 0.2\mu A$). Standby control turns off only the step-up converter and leaves the low-power linear regulator active ($I_Q = 7\mu A$).

The MAX710 has a preset 3.3V or 5V output voltage. The MAX711 has an adjustable output that can be set from +2.7V to +5.5V with two resistors. Both devices come in 16-pin narrow SO packages.

Applications

Single-Cell, Lithium-Powered Portable Devices
Digital Cameras
2- to 4-Cell AA Alkaline Hand-Held Equipment
3.3V and Other Low-Voltage Systems
2-, 3-, and 4-Cell Battery-Powered Equipment
Battery-Powered Devices with AC Input Adapters

Typical Operating Circuit

Features

- ◆ Step-Up/Down Voltage Conversion
- ◆ +1.8V to +11V Input Range
- ◆ Output:
 - 5V/250mA at $V_{IN} = 1.8V$
 - 5V/500mA at $V_{IN} = 3.6V$
- ◆ No External FETs Required
- ◆ Load Disconnected from Input in Shutdown
- ◆ Battery Drain:
 - 200 μA No-Load ($V_{IN} = 4V$)
 - 7 μA in Standby
 - 0.2 μA when Off
- ◆ Low-Noise and High-Efficiency Modes

 PGND to GND-0.3V to +0.3V
 REF Short Circuit to GNDContinuous
 I_{OUT}.....700mA

Continuous Power Dissipation (T_A = +70°C)
 SO (derate 8.70mW/°C above +70°C)696mW
 Operating Temperature Range-40°C to +85°C
 Storage Temperature Range-65°C to +160°C
 Junction Temperature+150°C
 Lead Temperature (soldering, 10sec)+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{PS} = 5.6V, \overline{STBY} = PS, C_{REF} = 0.1μF, C_{OUT} = 4.7μF, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 1)

Pin Description

PIN		NAME	FUNCTION
MAX710	MAX711		
1	1	LX	Drain Connection for internal N-channel power MOSFET
2	2	PGND	Power Ground
3	3	ILIM	Inductor Current-Limit-Select Input. Connect to GND for 1.5A limit and to PS for 0.8A limit.
4	4	$\overline{\text{SHDN}}$	Shutdown Input. When low, the entire circuit is off and OUT is actively pulled to GND.
5	5	$\overline{\text{STBY}}$	Standby Input. Connect to GND to disable boost circuit. Connect to PS for normal operation.
6	—	$3\overline{5}$	Selects the output voltage. Connect to GND for 5V output and to OUT for 3.3V output.
—	6	FB	Feedback Input
7	7	$\text{N}/\overline{\text{E}}$	Selects low-noise or high-efficiency mode. Connect to GND for high efficiency and to PS for lowest noise. See <i>Operating Configurations</i> section.
8	8	LBO	Low-Battery Comparator Output
9	9	OUT	Linear-Regulator Output. Bypass with a 4.7 μ F capacitor to GND.
10	10	LBI-	Negative Input to Low-Battery Comparator
11	11	LBI+	Positive Input to Low-Battery Comparator
12	12	PS	Source of internal PFET regulator. The IC is powered from PS.
13	13	REF	1.28V Reference Voltage Output. Bypass with a 0.1 μ F capacitor to GND.
14	14	GND	Analog Ground. Must be low impedance. Solder directly to ground plane.
15	15	PGND	Power Ground
16	16	LX	Drain Connection for internal N-channel power MOSFET

Detailed Description

The MAX710/MAX711 integrate a step-up DC-DC converter with a linear regulator to provide step-up/down voltage conversion. The step-up switch-mode regulator contains an N-channel power MOSFET switch. It also shares a precision voltage reference with a linear regulator that contains a P-channel MOSFET pass element (Figure 1).

Step-Up Operation

A pulse-frequency-modulation (PFM) control scheme with a constant 1 μ s off-time and variable on-time controls the N-channel MOSFET switch. The N-channel switch turns off when the part reaches the peak current limit or the 4 μ s maximum on-time. The ripple frequency is a function of load current and input voltage.

Step-Down Operation

The low-dropout linear regulator consists of a reference, an error amplifier, and a P-channel MOSFET. The reference is connected to the error amplifier's inverting

input. The error amplifier compares this reference with the selected feedback voltage and amplifies the difference. The difference is conditioned and applied to the P-channel pass transistor's gate.

Operating Configurations

The MAX710/MAX711 have several operating configurations to minimize noise and optimize efficiency for different input voltage ranges. These configurations are accomplished via the $\text{N}/\overline{\text{E}}$ input, which controls operation of the on-chip linear regulator.

With $\text{N}/\overline{\text{E}}$ low, the linear regulator behaves as a 0.7 Ω (at 5V output) PFET switch when the IC is boosting, and as a conventional linear regulator when $V_{\text{IN}} > V_{\text{OUT}}$. This provides optimum boost efficiency, but the PFET does little to reject boost-converter output ripple. With $\text{N}/\overline{\text{E}}$ high, boost ripple rejection is optimized by maintaining headroom (V_{FV} , typically 0.5V at 5V output) across the linear regulator. Boost mode efficiency is then about 10% lower than with $\text{N}/\overline{\text{E}}$ high.

3.3V/5V or Adjustable, Step-Up/Down DC-DC Converters

MAX710/MAX711

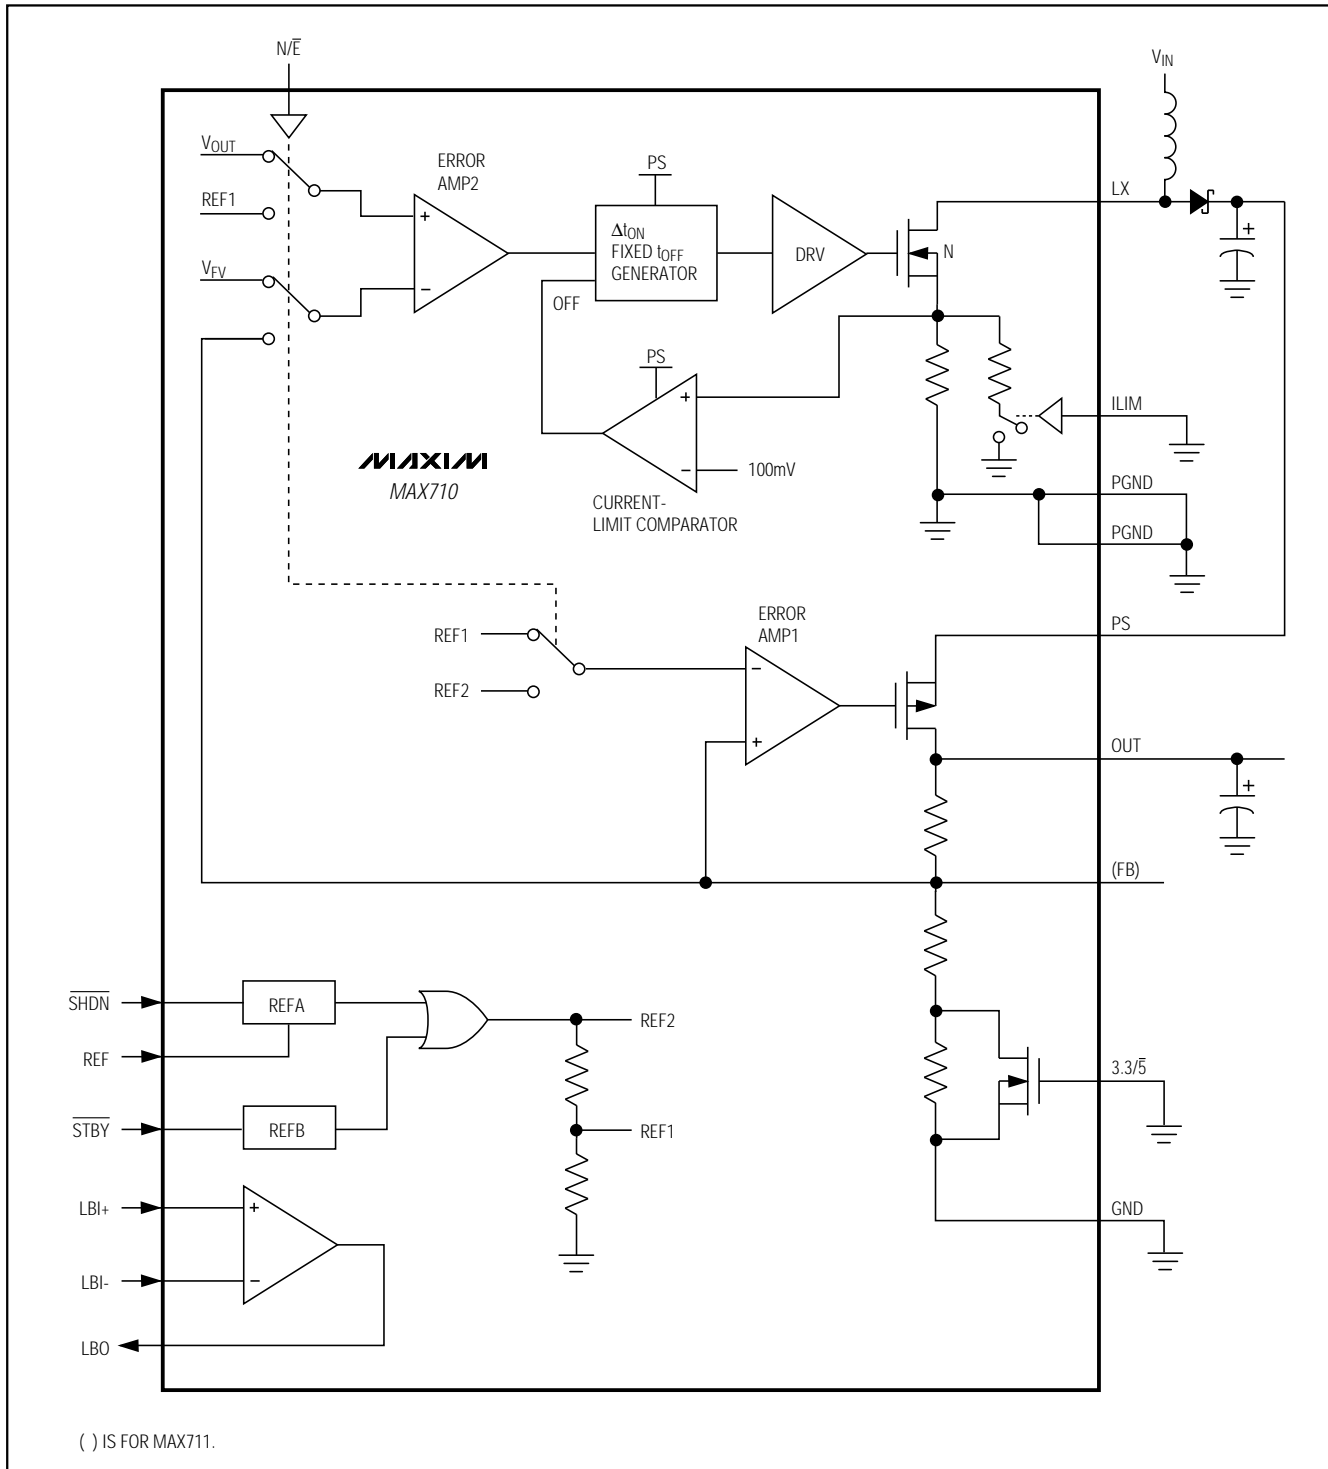

Figure 1. Functional Diagram

3.3V/5V or Adjustable, Step-Up/Down DC-DC Converters

In high-efficiency mode ($N/\bar{E} = \text{low}$), the maximum input voltage is limited to 7V. This voltage limitation is easily overcome, however, by configuring the LBO output to change modes based on input voltage, allowing an 11V maximum input with high-efficiency configurations. Four operating configurations are described in Table 1 and in the following subsections.

Table 1. Operating Configurations

NO.	DESCRIPTION	INPUT VOLTAGE	CONNECTIONS
1	High efficiency, 7V max V_{IN}	Up to 7V	$N/\bar{E} = \text{GND}$
2	High efficiency, $V_{BATT} < V_{OUT}$ (Figure 2a)	Up to 11V	LBO = N/\bar{E} LBI- = V_{OUT} LBI+ = V_{IN}
3	High efficiency, 11V, $V_{BATT} < 6.5V$ (Figure 2b)	Up to 11V	LBO = N/\bar{E} LBI- = REF LBI+ = R5, R6
4	Low noise	Up to 11V	$N/\bar{E} = \text{PS}$

Configuration 1: High Efficiency, 7V Max V_{IN}

With N/\bar{E} connected to GND, when the IC boosts, the linear regulator operates only as a switch, with minimum forward drop, until $V_{IN} > V_{OUT}$ (where linear regulation begins). This configuration is limited to no more than 7V input, but provides best efficiency for battery-only operation or low-voltage AC adapter usage.

Configuration 2: High Efficiency, $V_{BATT} < V_{OUT}$

In this configuration, N/\bar{E} is driven high by LBO when $V_{IN} > V_{OUT}$ (Figure 2a). When $V_{IN} < V_{OUT}$, the IC boosts, and the linear regulator operates as a switch, with minimum forward drop. When $V_{IN} > V_{OUT}$, the linear regulator operates with V_{FV} forward drop, while V_{PS} increases by V_{FV} so that OUT maintains regulation. V_{FV} is set inside the IC to approximately 0.5V (at 5V V_{OUT}). When V_{IN} is only slightly higher than V_{OUT} , conversion efficiency is poorer than in configuration 1, so configuration 2 is most suitable when the battery voltage is less than V_{OUT} , but the AC adapter output is greater than V_{OUT} .

Figure 2a. High-Efficiency Operating Configuration for $V_{BATT} < V_{OUT}$

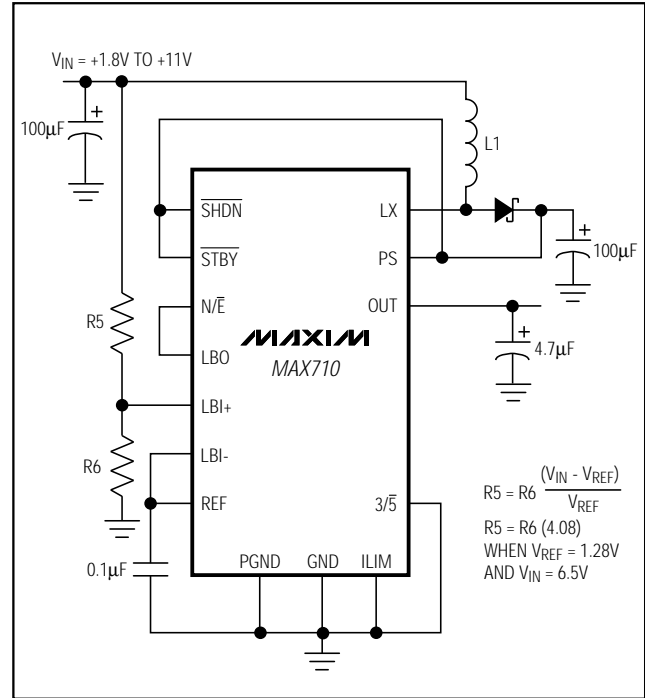

Figure 2b. High-Efficiency Operating Configuration for $V_{BATT} < 6.5V$

Table 2. Component Selection

INDUCTORS (L1)	CAPACITORS	RECTIFIERS (D1)
Sumida CD75-220 (1.5A), CDRH-74-220 (1.23A), or CD54-220	100 μ F, 16V low-ESR tantalum capacitor AVX TPSE107M016R0100 or Sprague 593D107X0016E2W	Schottky diode Motorola MBRS130T3
Coilcraft DO33-08P-223	4.7 μ F, 16V tantalum capacitor Sprague 595D475X0016A2T	

where V_{LBT} is the desired threshold of the low-battery detector and V_{LBI} is the voltage applied to the inverting input of the low-battery comparator. Since LBI current is less than 50nA, R3 and R4 can be large (typically 100k Ω to 1M Ω), minimizing input supply loading. If the low-battery comparator is not used, connect LBI+ to PS and LBI- to REF, leaving LBO unconnected.

Inductor Selection

A 22 μ H inductor value performs well in most MAX710/MAX711 applications. The inductance value is not critical, however, since the MAX710/MAX711 work with inductors in the 18 μ H to 100 μ H range. Smaller inductance values typically offer a smaller size for a given series resistance, allowing the smallest overall circuit dimensions. Circuits using larger inductance values exhibit higher output current capability and larger physical dimensions for a given series resistance. The inductor's incremental saturation current rating should be greater than the peak switch-current limit, which is 1.5A for ILIM = GND and 0.8A for ILIM = PS. However, it is generally acceptable to bias most inductors into saturation by as much as 20%, although this slightly reduces efficiency. The inductor's DC resistance significantly affects efficiency. See Tables 2 and 3 for a list of suggested inductors and suppliers.

Capacitor Selection

A 100 μ F, 16V, 0.1 Ω equivalent series resistance (ESR), surface-mount tantalum (SMT) output filter capacitor, C2, typically exhibits 50mV output ripple when stepping up from 2V to 5V at 100mA. Smaller capacitors (down to 10 μ F with higher ESRs) are acceptable for light loads or in applications that can tolerate higher output ripple. The ESR of both bypass and filter capacitors affects efficiency and output ripple. Output voltage ripple is the product of the peak inductor current and the output capacitor's ESR. Use low-ESR capacitors for best performance, or connect two or more filter capacitors in parallel. Low-ESR, SMT capacitors are currently available from Sprague (595D series) and AVX (TPS series). Sanyo OS-CON organic-semiconductor through-hole capacitors also exhibit very low ESR and are especially

useful for operation at cold temperatures. The output capacitor, C3, needs to be only 4.7 μ F to maintain linear regulator stability. See Tables 2 and 3 for a list of suggested capacitors and suppliers.

Rectifier Diode

For optimum performance, use a switching Schottky diode. Refer to Tables 2 and 3 for the suggested diode and supplier.

Applications Information

The MAX710/MAX711 high-frequency operation makes PC layout important for minimizing ground bounce and noise. Keep the IC's GND pin and the ground leads of C1 and C2 (Figure 1) less than 0.2in. (5mm) apart. Also keep all connections to the FB and LX pins as short as possible. To maximize output power and efficiency and minimize output ripple voltage, use a ground plane and solder the IC's GND pin directly to the ground plane.
