## Complete, 12-Bit Multiplying DAC

MX7845

### General Description

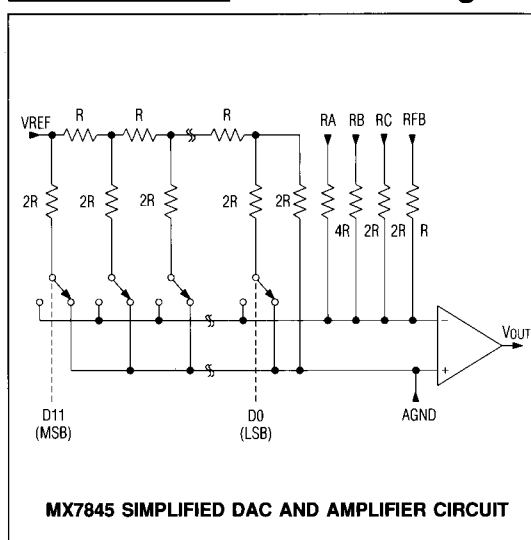

The MX7845 is a 12-bit, voltage-output, 4-quadrant, multiplying digital-to-analog converter (DAC). A precision internal output amplifier and thin-film resistors, laser-trimmed at the wafer level, maintain accuracy over the full operating temperature range. The output amplifier is internally compensated and drives  $\pm 10V$  into a  $2k\Omega$  load.

The MX7845 has buffered latches that are easily interfaced with microprocessors. Data is transferred into the input register from a 12-bit-wide data path. The input registers are controlled by standard CHIP SELECT (CS) and WRITE (WR) signals. For stand-alone operation, the CS and WR inputs are grounded, making all latches transparent. All logic inputs are level-triggered and compatible with TTL and +5V CMOS logic levels. For a detailed description of MX7845 operation, refer to the MAX501/MAX502 data sheet.

### Applications

Automatic Test Equipment  
Digital Attenuators  
Programmable Power Supplies  
Programmable-Gain Amplifiers  
Digital to 4-20mA Converters

### Functional Diagram

### Features

- ◆ Complete MDAC with Output Amplifier
- ◆ 4-Quadrant Multiplication
- ◆ Guaranteed Monotonic ( $T_{MIN}$  to  $T_{MAX}$ )
- ◆ Matched Application Resistors
- ◆ Small 0.3" 24-Pin DIP Package

**Note 1:** V<sub>OUT</sub> may be shorted to AGND, V<sub>DD</sub>, or V<sub>SS</sub> if the package power dissipation is not exceeded.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
