## BLOCK DIAGRAM

## DESCRIPTION

The SY89206V and SY89216V are differential PECL/ECL receiver/buffers in a space-saving (2mm  $\times$  2mm) MLF™ package. The devices are functionally equivalent to the SY10/100EL16V, but feature a 70% smaller footprint.

The SY89206/216V provide a  $V_{BB}$  output for either single-ended use or as a DC bias for AC-coupling to the device. The  $V_{BB}$  pin should be used only as a bias for the SY89206/16V as its current sink/source capability is limited. Whenever used, the  $V_{BB}$  pin should be bypassed with a 0.01 $\mu\text{F}$  capacitor to  $V_{CC}$ .

Under open input conditions (pulled to  $V_{EE}$ ), internal input clamps will force the Q output LOW.

**Note 1.** Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATING conditions for extended periods may affect device reliability.

**Note 2.** The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.

**Note 3.** Package Thermal Resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB.

**Note 4.** Output loaded with  $50\Omega$  to  $V_{CC}-2V$ .

**Note 5.**  $V_{IN} = V_{IL}$  (min) or  $V_{IH}$  (max)

**Note 6.** Duty cycle skew is the difference between a  $t_{PLH}$  and  $t_{PHL}$  propagation delay through a device.

**Note 7.** Minimum input swing for which AC parameters are guaranteed. The device has a DC gain of  $\approx 40V/V$ .

**Note 8.** The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between  $V_{PP}$  min. and 1V. The lower end of the CMR range varies 1:1 with  $V_{EE}$ . The numbers in the specification table assume a nominal  $V_{EE} = -3.3V$ . Note for PECL operation, the  $V_{CMR}$  (min) will be fixed at  $3.3V - |V_{CMR}(\text{min})|$ .
