

MMC 4098

DUAL MONOSTABLE MULTIVIBRATOR

GENERAL DESCRIPTION

The MMC 4098 is a monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package. The MMC 4098 dual monostable multivibrator provides stable retriggerable/resettable one-shot operation for any fixed-voltage timing application. An external resistor (R_X) and an external capacitor (C_X) control the timing for the circuit. Adjustment of R_X and C_X provides a wide range of output pulse widths from the Q and \bar{Q} terminals. The time delay from trigger input to output transition (trigger propagation delay) and the time delay from reset input to output transition (reset propagation delay) are independent of R_X and C_X .

Leading-edge-triggering (+TR) and trailing-edge-triggering (-TR) inputs are provided for triggering from either edge of an input pulse. An unused +TR input should be tied to V_{SS} . An unused -TR input should be tied to V_{DD} . A RESET (on low level) is provided for immediate termination of the output pulse or to prevent output pulses when power is turned on. An unused RESET input should be tied to V_{DD} . However, if an entire section of the MMC 4098 is not used, its RESET should be tied to V_{SS} . See Table I. In normal operation the circuit triggers (extends the output pulse one period) on the application of each new trigger pulse. For operation in the non-triggera-

ble mode, Q is connected to -TR when leading-edge triggering(+TR) is used or Q is connected to +TR when trailing-edge triggering (-TR) is used. The time period (T) for this multivibrator can be approximated

by: $T_X = \frac{1}{2} R_X C_X$ for $C_X \geq 0.01 \mu F$. Values of T

vary from unit to unit and as a function of voltage, temperature, and $R_X C_X$. The minimum value of external resistance, R_X , is 5 k Ω . The maximum value of external capacitance, C_X , is 100 μF . The output pulse width has variations of $\pm 2.5\%$ typically over the temperature range of $-55^\circ C$ to $125^\circ C$ for $C_X = 1000$ pF and $R_X = 100$ k Ω .

For power supply variations of $\pm 5\%$, the output pulse width has variations of $\pm 0.5\%$ typically, for $V_{DD} = 10$ V and 15 V and $\pm 1\%$ typically, for $V_{DD} = 5$ V at $C_X = 1000$ pF and $R_X = 5$ k Ω .

FEATURES

- Retriggerable/resettable capability
- Trigger and reset propagation delays independent of $R_X C_X$
- Triggering from leading or trailing edge
- Q and \bar{Q} buffered outputs available
- Separate resets
- Wide range of output-pulse widths

ABSOLUTE MAXIMUM RATINGS

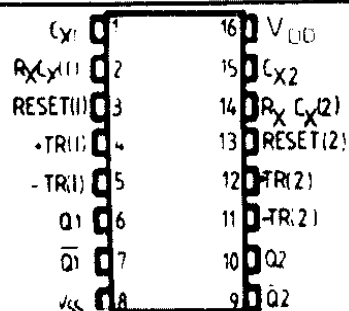

V_{DD}^*	Supply voltage: G and H types	-0.5 to	20	V
	E and F types	-0.5 to	18	V
V_i	Input voltage	-0.5 to	$V_{DD} + 0.5$	V
I_i	DC input current (any one input)		± 10	mA
P_{tot}	Total power dissipation (per package)		200	mW
	Dissipation per output transistor for T_A = full package-temperature range		100	mW
T_A	Operating temperature: G and H types	-55 to	125	$^\circ C$
	E and F types	-40 to	85	$^\circ C$
T_{stg}	Storage temperature	-65 to	150	$^\circ C$

* All voltage values are referred to V_{SS} pin voltage

RECOMMENDED OPERATING CONDITIONS

V_{DD}^*	Supply voltage: G and H types	3 to	18	V
	E and F types	3 to	15	V
V_i	Input voltage	0 to	V_{DD}	V
T_A	Operating temperature: G and H types	-55 to	125	$^\circ C$
	E and F types	-40 to	85	$^\circ C$

CONNECTION DIAGRAM

FUNCTIONAL DIAGRAM
