DRAM MODULE

MT2D(T)132(X)
MT4D(T)232D(X)

For the latest data sheet revisions, please refer to the Micron Web site: www.micron.com/datasheets

FEATURES

- JEDEC- and industry-standard pinout in a 72-pin, single in-line memory module (SIMM)
- 4MB (1 Meg x 32) and 8MB (2 Meg x 32)
- High-performance CMOS silicon-gate process
- Single +5V ±10% power supply
- All inputs, outputs and clocks are TTL-compatible
- Refresh modes: RAS#-ONLY, CAS#-BEFORE-RAS# (CBR) and HIDDEN
- Multiple RAS# lines allow x16 or x32 width
- 1,024-cycle refresh distributed across 16ms
- FAST PAGE MODE (FPM) access or Extended Data-Out (EDO) PAGE MODE access

GENERAL DESCRIPTION

The MT2D(T)132(X) and MT4D(T)232D(X) are randomly accessed, 4MB and 8MB solid-state memories organized in a x32 configuration. During READ or WRITE cycles, each bit is uniquely addressed through 20 address bits that are entered 10 bits (A0-A9) at a time. RAS# is used to latch the first 10 bits and CAS# the latter 10 bits. A READ or WRITE cycle is selected with the WE# input. A logic HIGH on WE# dictates read mode, while a logic LOW on WE# dictates write mode. During a WRITE cycle, data-in (D) is latched by the falling edge of WE# or CAS#, whichever occurs last. EARLY WRITE occurs when WE# goes LOW prior to CAS# going LOW, and the output pin(s) remain open (High-Z) until the next CAS# cycle.

FAST PAGE MODE

FAST-PAGE-MODE operations allow faster data operations (READ or WRITE) within a row-address-defined (A0-A9) page boundary. The FAST-PAGE-MODE cycle is always initiated with a row address strobed in by RAS# followed by a column address strobed in by CAS#. Additional columns may be accessed by providing valid column addresses, strobing CAS# and holding RAS# LOW, thus executing faster memory cycles. Returning RAS# HIGH terminates the FAST-PAGE-MODE operation.

PRD4	70	Vss	NC

EDO PAGE MODE

EDO PAGE MODE, designated by the "X" version, is an accelerated FAST-PAGE-MODE cycle. The primary advantage of EDO is the availability of data-out even after CAS# goes back HIGH. EDO provides for CAS# precharge time (^{t}CP) to occur without the output data going invalid. This elimination of CAS# output control provides for pipelined READs.

FAST-PAGE-MODE modules have traditionally turned the output buffers off (High-Z) with the rising edge of CAS#. EDO operates as any DRAM READ or FAST-PAGE-MODE READ, except data will be held valid or become valid after CAS# goes HIGH, as long as RAS# and OE# are held LOW. (Refer to the MT4LC1M16E5 DRAM data sheet for additional information on EDO functionality.)

REFRESH

Returning RAS# and CAS# HIGH terminates a memory cycle and decreases chip current to a reduced standby level. Also, the chip is preconditioned for the next cycle during the RAS# HIGH time. Memory cell data is retained in its correct state by maintaining power and executing anyRAS# cycle (READ, WRITE) or RAS# REFRESH cycle (RAS#-ONLY, CBR or HIDDEN) so that all 1,024 combination of RAS# addresses (A0-A9) are executed at least every 16ms, regardless of sequence.

X16 CONFIGURATION

For x16 applications, the corresponding DQ and CAS# pins must be connected together (DQ1 to DQ17, DQ2 to DQ18 and so forth, and CAS0# to CAS2# and CAS1# to CAS3#). Each RAS# is then a bank select for the x16 memory organization.

NOTES

1. All voltages referenced to V_{SS}.
2. I_{CC} is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the output open.
3. An initial pause of 100µs is required after power-up, followed by eight RAS# refresh cycles (RAS#-ONLY or CBR with WE# HIGH), before proper device operation is ensured. The eight RAS# cycle wake-ups should be repeated any time the ^{t}REF refresh requirement is exceeded.
4. AC characteristics assume ^{t}T = 5ns for FPM and ^{t}T = 2.5ns for EDO.
5. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} or between V_{IL} and V_{IH}.
6. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range ($0°C \leq T_A \leq 70°C$) is ensured.
7. Measured with a load equivalent to two TTL gates and 100pF, V_{OL} = 0.8V and V_{OH} = 2V.
8. If CAS# = V_{IH}, data output is High-Z.
9. If CAS# = V_{IL}, data output may contain data from the last valid READ cycle.
10. ^{t}OFF (MAX) defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL}.
11. The ^{t}RCD (MAX) limit is no longer specified. ^{t}RCD (MAX) was specified as a reference point only. If ^{t}RCD was greater than the specified ^{t}RCD (MAX) limit, then access time was controlled exclusively by ^{t}CAC (^{t}RAC [MIN] no longer applied). With or without the ^{t}RCD (MAX) limit, ^{t}AA and ^{t}CAC must always be met.
12. Either ^{t}RCH or ^{t}RRH must be satisfied for a READ cycle.
13. These parameters are referenced to CAS# leading edge in EARLY WRITE cycles.
14. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
15. This parameter is sampled. Capacitance is measured using MIL-STD-883C, Method 3012.1 (1 MHz AC, V_{DD} = 4.5V, DC bias = 2.4V at 15mV RMS).
16. If CAS# is LOW at the falling edge of RAS#, data-out (Q) will be maintained from the previous cycle. To initiate a new cycle and clear the data-out buffer, CAS# must be pulsed HIGH for ^{t}CP.
17. On-chip refresh and address counters are enabled.
18. A HIDDEN REFRESH may also be performed after a WRITE cycle. In this case, WE# = LOW.
19. LATE WRITE, READ-WRITE or READ-MODIFY-WRITE cycles are not available due to OE# being grounded on U1-U2/U4.
20. The ^{t}RAD (MAX) limit is no longer specified. ^{t}RAD (MAX) was specified as a reference point only. If ^{t}RAD was greater than the specified ^{t}RAD (MAX) limit, then access time was controlled exclusively by ^{t}AA (^{t}RAC and ^{t}CAC no longer applied). With or without the ^{t}RAD (MAX) limit, ^{t}AA, ^{t}RAC and ^{t}CAC must always be met.
21. The 3ns minimum is a parameter guaranteed by design.
22. Column address changed once each cycle.
23. 4MB module values will be half of those shown.
24. For the FPM option, ^{t}OFF is determined by the first RAS# or CAS# signal to transition HIGH. In comparison, ^{t}OFF on an EDO option is determined by the latter of the RAS# and CAS# signals to transition HIGH.
25. Applies to both EDO and FPM modules.
