

**DESCRIPTION**

The LX8580A is a high-performance, very low dropout voltage regulator, designed for use with advanced microprocessors, micro controllers, or video graphics controllers. This product can be used with separate voltage supplies for the control and power sections, allowing a power regulation dropout voltage as low as 100mV @ 1.5A. In AGP bus systems requiring regulation of 3.3V to 2.85V @ 3A, the LX8580A has a max dropout of 250mV making it an ideal power supply solution for today's graphics applications.

The LX8580A can also be used in a single voltage supply configuration with a dropout performance

similar to that of the LX8584 (1.3V @ 7.5A).

The LX8580A is supplied in a five-terminal TO-220, TO-263, or Linfinity's S-PAK packages, which allows the implementation of remote (Kelvin) voltage sensing. This sensing compensates for output voltage variations due to load changes and resistive voltage drops in connectors and board traces. Typical load regulation measured at the sense pin is less than 1mV for a load current step of 7mA to 7.5A.

The LX8580A is ideal for generating a secondary 2V-2.85V low voltage supply on a motherboard where a 3.3V supply is already available.

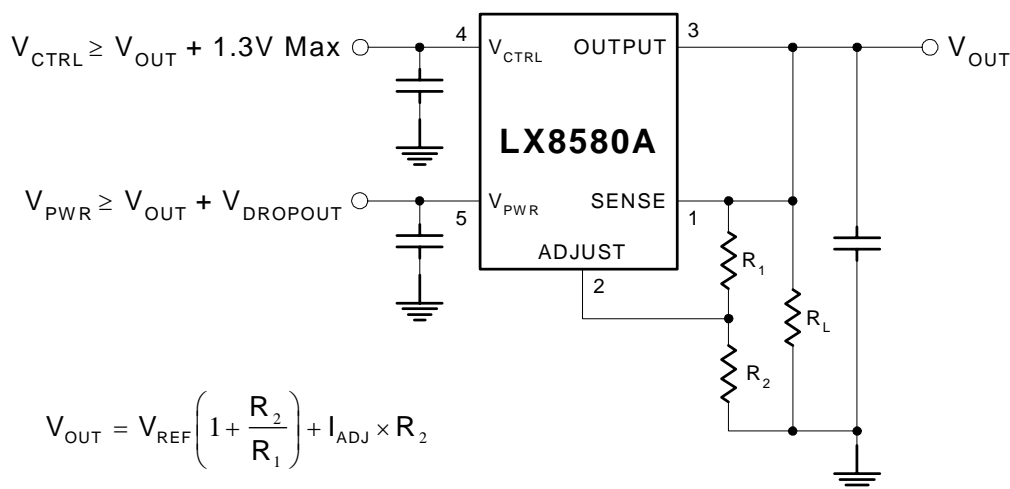

**KEY FEATURES**

- Low Dropout, 650mV at 7.5A Output Current in Dual Supply Mode
- Fast Transient Response
- Remote Sensing
- 1mV Load Regulation
- Adjustable Output

**APPLICATIONS/BENEFITS**

- Microprocessor/Micro controller Supplies
- 3.3V to 2.85V Voltage Conversion
- High-Current Regulators
- Post Regulation for Switching Power Supplies

**FUNCTIONAL PIN DESCRIPTION**

PIN	NAME	DESCRIPTION
1	SENSE	This pin is the positive side of the reference voltage for the device. With this pin it is possible to Kelvin-sense the output voltage at the load.
2	ADJUST	This pin is the negative side of the reference voltage for the device. Ripple rejection can be improved by adding a small bypass capacitor from the ADJUST pin to ground. The capacitor value should be selected so that: $C_R \leq \frac{1}{2\pi F_R R_1}$ where $F_R$ is the ripple frequency and $R_1$ is the value of the resistor between the ADJUST and SENSE leads of the LX8580A
3	OUTPUT	This is the regulated power output of the device
4	$V_{CTRL}$	This pin is the voltage supply pin for the control circuitry of the device. The current flow into this pin will be about 1% of the output current. Please refer to the electrical characteristics section of the data sheet for dropout voltage for load conditions.
5	$V_{PWR}$	This is the collector of the power section of the LX8580A. The output load current is supplied through this pin. For the device to regulate, the voltage at this pin must be between 0.1V and 0.8V greater than the output voltage (Higher output current require higher voltages differences between $V_{PWR}$ and OUTPUT).

**ELECTRICAL CHARACTERISTICS**

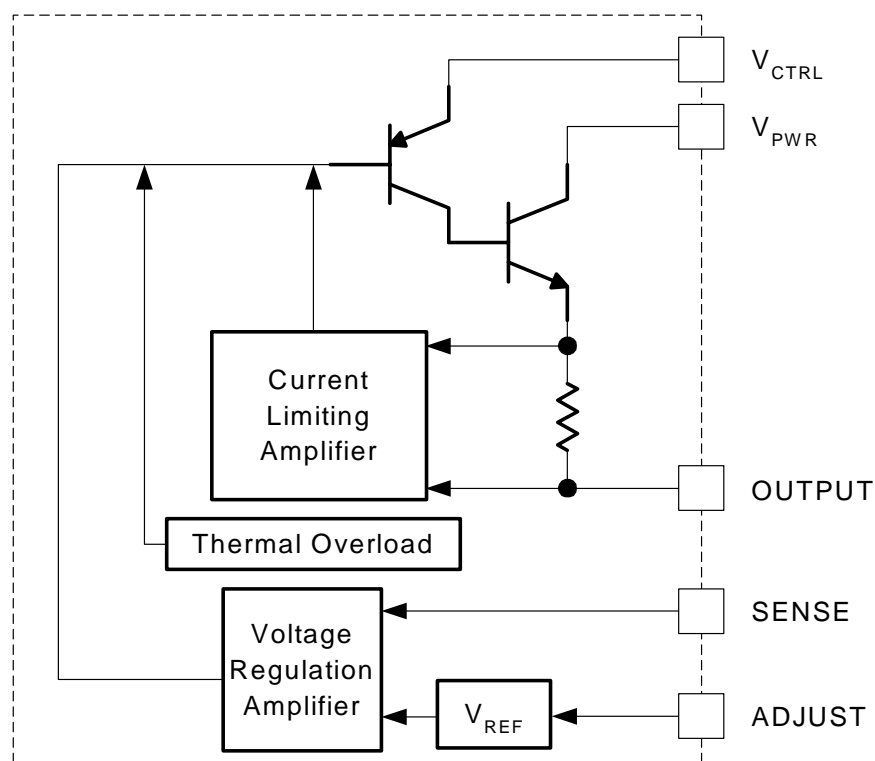

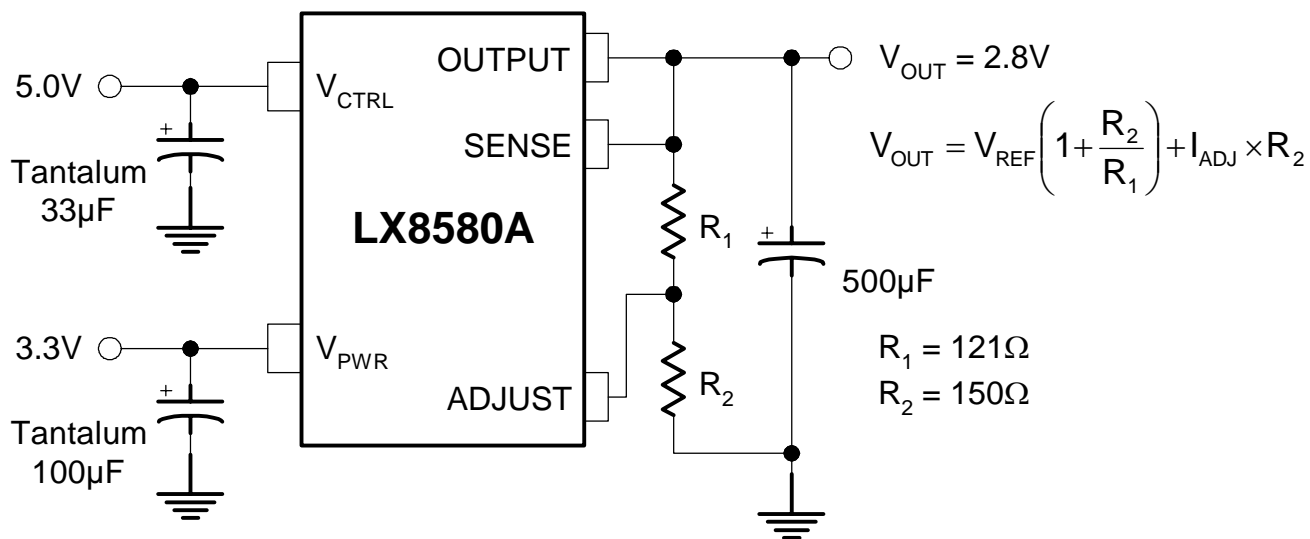

Unless otherwise specified, the following specifications apply over the operating ambient temperature  $0^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ . Low duty cycle pulse testing techniques are used which maintains junction and case temperatures are equal to the ambient temperature.

Note 1: Dropout is caused by either minimum control voltage ( $V_{\text{CTRL}}$ ) or minimum power voltage ( $V_{\text{PWR}}$ ). Both parameters are specified with respect to the output voltage. The specifications represent the minimum input/output voltage required to maintain 1% regulation.

Note 2: The control pin current is the drive current required for the output transistor. This current will track output current with roughly a 1:100 ratio. The minimum value is equal to the quiescent current of the device.

Note 3: Minimum load current is defined as the amount of output current required to maintain regulation. Typically this current provides the bias to the external resistor divider network used to set the output voltage.
