

DESCRIPTION

M2S12D20TP is a 4-bank x 33,554,432-word x 4-bit,
 M2S12D30TP is a 4-bank x 16,777,216-word x 8-bit,
 double data rate synchronous DRAM, with SSTL_2 interface. All control and address signals are referenced to the rising edge of CLK. Input data is registered on both edges of data strobes, and output data and data strobe are referenced on both edges of CLK. The M2S12D20/30TP achieve very high speed data rate up to 133MHz, and are suitable for main memory in computer systems.

FEATURES

- $V_{dd}=V_{ddq}=2.5V\pm0.2V$
- Double data rate architecture; two data transfers per clock cycle
- Bidirectional, data strobe (DQS) is transmitted/received with data
- Differential clock inputs (CLK and /CLK)
- DLL aligns DQ and DQS transitions
- Commands are entered on each positive CLK edge;
- data and data mask are referenced to both edges of DQS
- 4 bank operations are controlled by BA0, BA1 (Bank Address)
- /CAS latency- 2.0/2.5 (programmable)
- Burst length- 2/4/8 (programmable)
- Burst type- sequential / interleave (programmable)
- Auto precharge / All bank precharge is controlled by A10
- 8192 refresh cycles /64ms (4 banks concurrent refresh)
- Auto refresh and Self refresh
- Row address A0-12 / Column address A0-9,11-12(x4)/ A0-9,11(x8)
- SSTL_2 Interface
- 400-mil, 66-pin Thin Small Outline Package (TSOP II)
- JEDEC standard
- Low Power for the Self Refresh Current $ICC6 :4mA$ (-75L,-10L)

Operating Frequencies

Speed Grade	Clock Rate	
	CL=2 *	CL=2.5 *
-75 / -75L	100MHz	133MHz
-10 / -10L	100MHz	125MHz

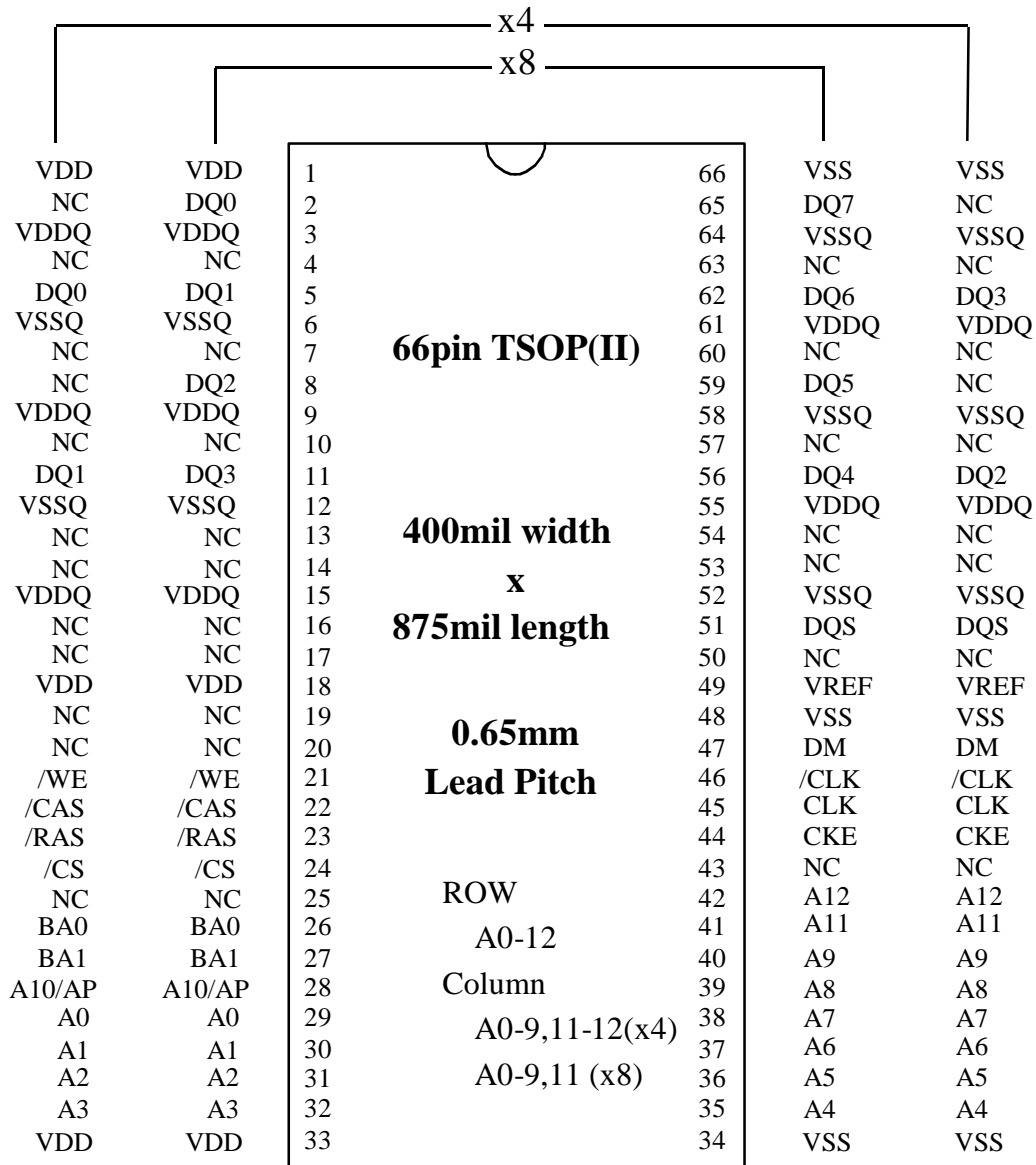

* CL = CAS(Read) Latency

Contents are subject to change without notice.

512M Double Data Rate Synchronous DRAM

PIN CONFIGURATION(TOP VIEW)

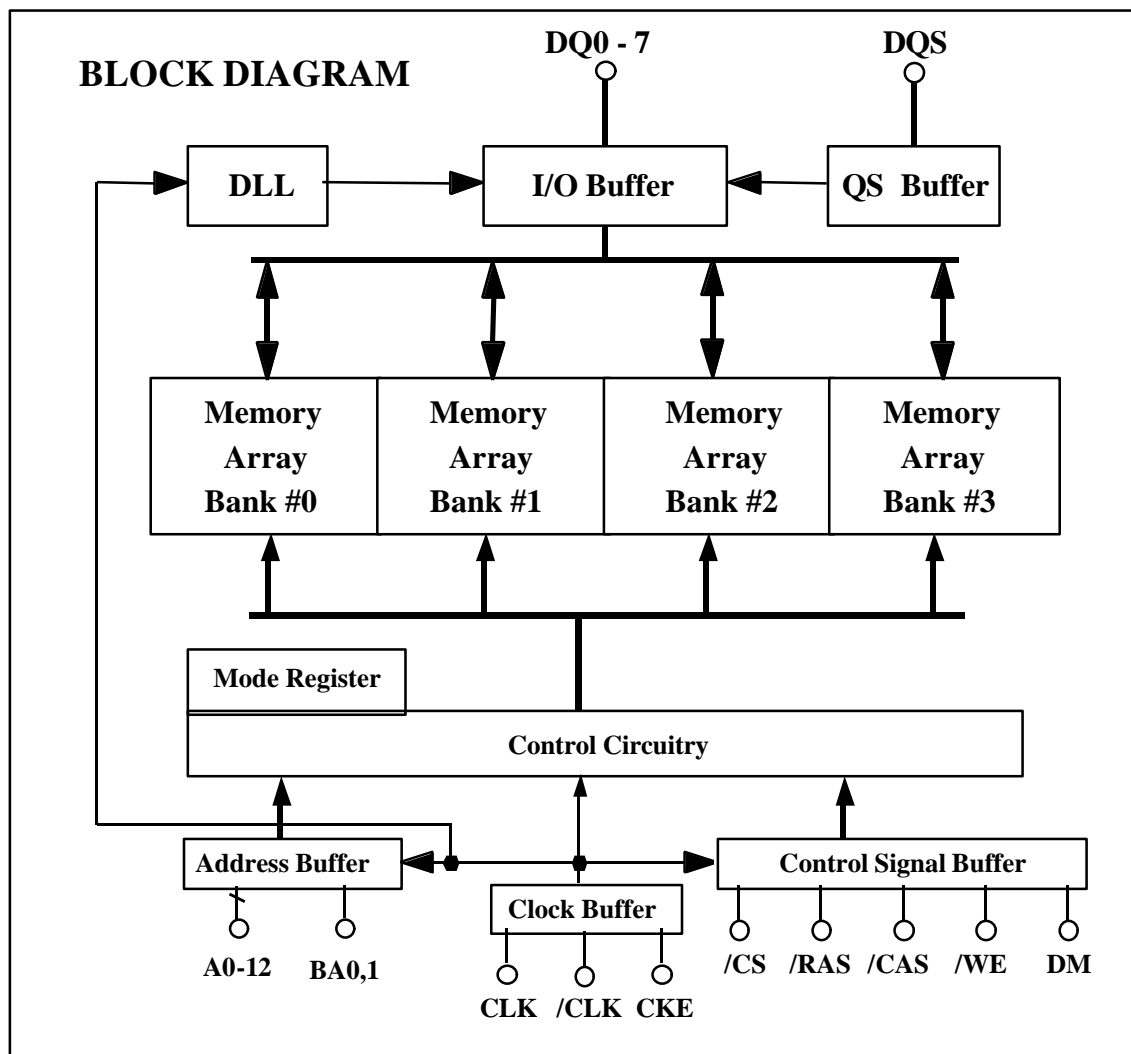

PIN FUNCTION

SYMBOL	TYPE	DESCRIPTION
CLK, /CLK	Input	Clock: CLK and /CLK are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CLK and negative edge of /CLK. Output (read) data is referenced to the crossings of CLK and /CLK (both directions of crossing).
CKE	Input	Clock Enable: CKE controls internal clock. When CKE is low, internal clock for the following cycle is ceased. CKE is also used to select auto / self refresh. After self refresh mode is started, CKE becomes asynchronous input. Self refresh is maintained as long as CKE is low.
/CS	Input	Chip Select: When /CS is high, any command means No Operation.
/RAS, /CAS, /WE	Input	Combination of /RAS, /CAS, /WE defines basic commands.
A0-12	Input	A0-12 specify the Row / Column Address in conjunction with BA0,1. The Row Address is specified by A0-12. The Column Address is specified by A0-9,11-12(x4) and A0-9,11(x8). A10 is also used to indicate precharge option. When A10 is high at a read / write command, an auto precharge is performed. When A10 is high at a precharge command, all banks are precharged.
BA0,1	Input	Bank Address: BA0,1 specifies one of four banks to which a command is applied. BA0,1 must be set with ACT, PRE, READ, WRITE commands.
DQ0-7(x8), DQ0-3(x4)	Input / Output	Data Input/Output: Data bus
DQS	Input / Output	Data Strobe: Output pin during Read operation, input during Write operation. Edge-aligned with read data, placed at the centered of write data to capture the write data.
DM	Input	Input Data Mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with the input data during a WRITE operations. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
Vdd, Vss	Power Supply	Power Supply for the memory array and peripheral circuitry.
VddQ, VssQ	Power Supply	VddQ and VssQ are supplied to the Output Buffers only.
Vref	Input	SSTL_2 reference voltage.

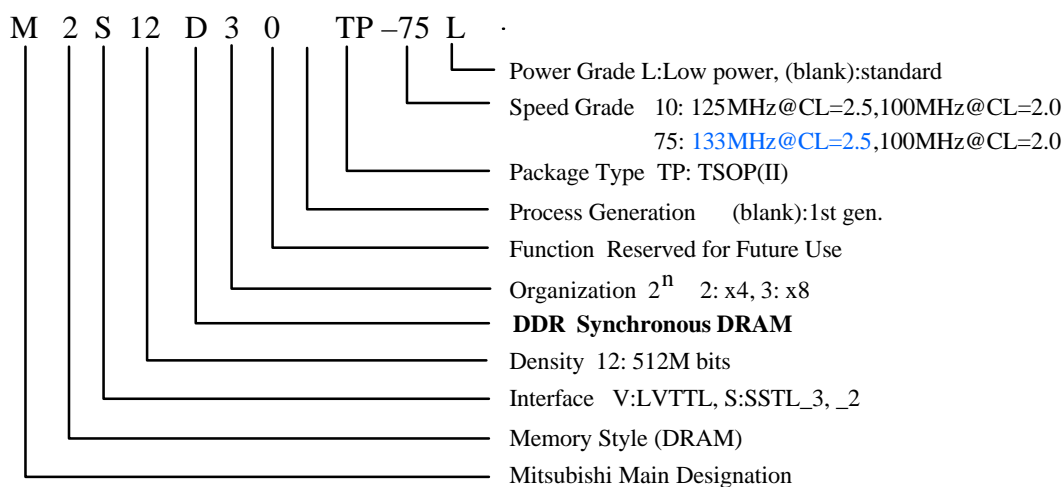

M2S12D20/ 30TP -75, -75L, -10, -10L

512M Double Data Rate Synchronous DRAM

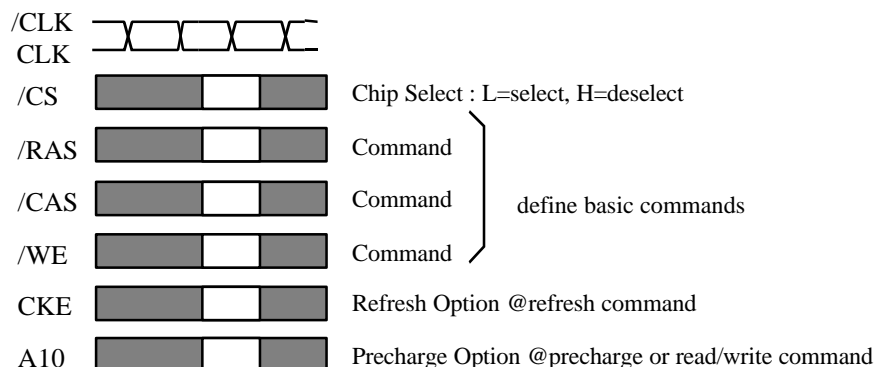

Type Designation Code

This rule is applied to only Synchronous DRAM family.

BASIC FUNCTIONS

The M2S12D20/30TP provides basic functions, bank (row) activate, burst read / write, bank (row) precharge, and auto / self refresh. Each command is defined by control signals of /RAS, /CAS and /WE at CLK rising edge. In addition to 3 signals, /CS, CKE and A10 are used as chip select, refresh option, and precharge option, respectively. Refer to the command truth table for the detailed definition of commands.

Activate (ACT) [/RAS =L, /CAS =/WE =H]

ACT command activates one row in an idle bank indicated by BA.

Read (READ) [/RAS =H, /CAS =L, /WE =H]

READ command starts burst read from the active bank indicated by BA. First output data appears after /CAS latency. When A10 =H in this command, the bank is deactivated after the burst read (auto-precharge, **READA**)

Write (WRITE) [/RAS =H, /CAS =/WE =L]

WRITE command starts burst write to the active bank indicated by BA. Total data length to be written is defined by burst length. When A10 =H in this command, the bank is deactivated after the burst write (auto-precharge, **WRITEA**)

Precharge (PRE) [/RAS =L, /CAS =H, /WE =L]

PRE command deactivates the active bank indicated by BA. This command also terminates burst read /write operation. When A10 =H in this command, all banks are deactivated (precharge all, **PREA**).

Auto-Refresh (REFA) [/RAS =/CAS =L, /WE =CKE =H]

REFA command starts auto-refresh cycle. Refresh addresses including bank address are generated internally. After this command, the banks are precharged automatically.

H=High Level, L=Low Level, V=Valid, X=Don't Care, n=CLK cycle number

NOTE:

- Applies only to read bursts while autoprecharge is disabled; this command is undefined (and should not be used) during read bursts while autoprecharge is enabled, as well as write bursts.
- BA0-BA1 select either the Base or the Extended Mode Register (BA0 = 0, BA1 = 0 selects Mode Register; BA0=1 , BA1 = 0 selects Extended Mode Register; other combinations of BA0-BA1 are reserved; A0-A12 provide the op-codes to be written to the selected Mode Register.

ABBREVIATIONS:

H=High Level, L=Low Level, X=Don't Care

BA=Bank Address, RA=Row Address, CA=Column Address, NOP=No Operation

NOTES:

1. All entries are valid only when CKE was High during the preceding clock cycle and the current clock cycle.
2. ILLEGAL to bank in specified state; function may be legal in the bank indicated by BA, depending on the state of specific bank.
3. Must satisfy bus contention, bus turn around, write recovery requirements.
4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
5. ILLEGAL if any bank is not idle.
6. Refer to Read with Auto-Precharge in page 23.
7. Refer to Write with Auto-Precharge in page 25.

ILLEGAL = Device operation and/or data-integrity are not guaranteed.

H=High Level, L=Low Level, X=Don't Care

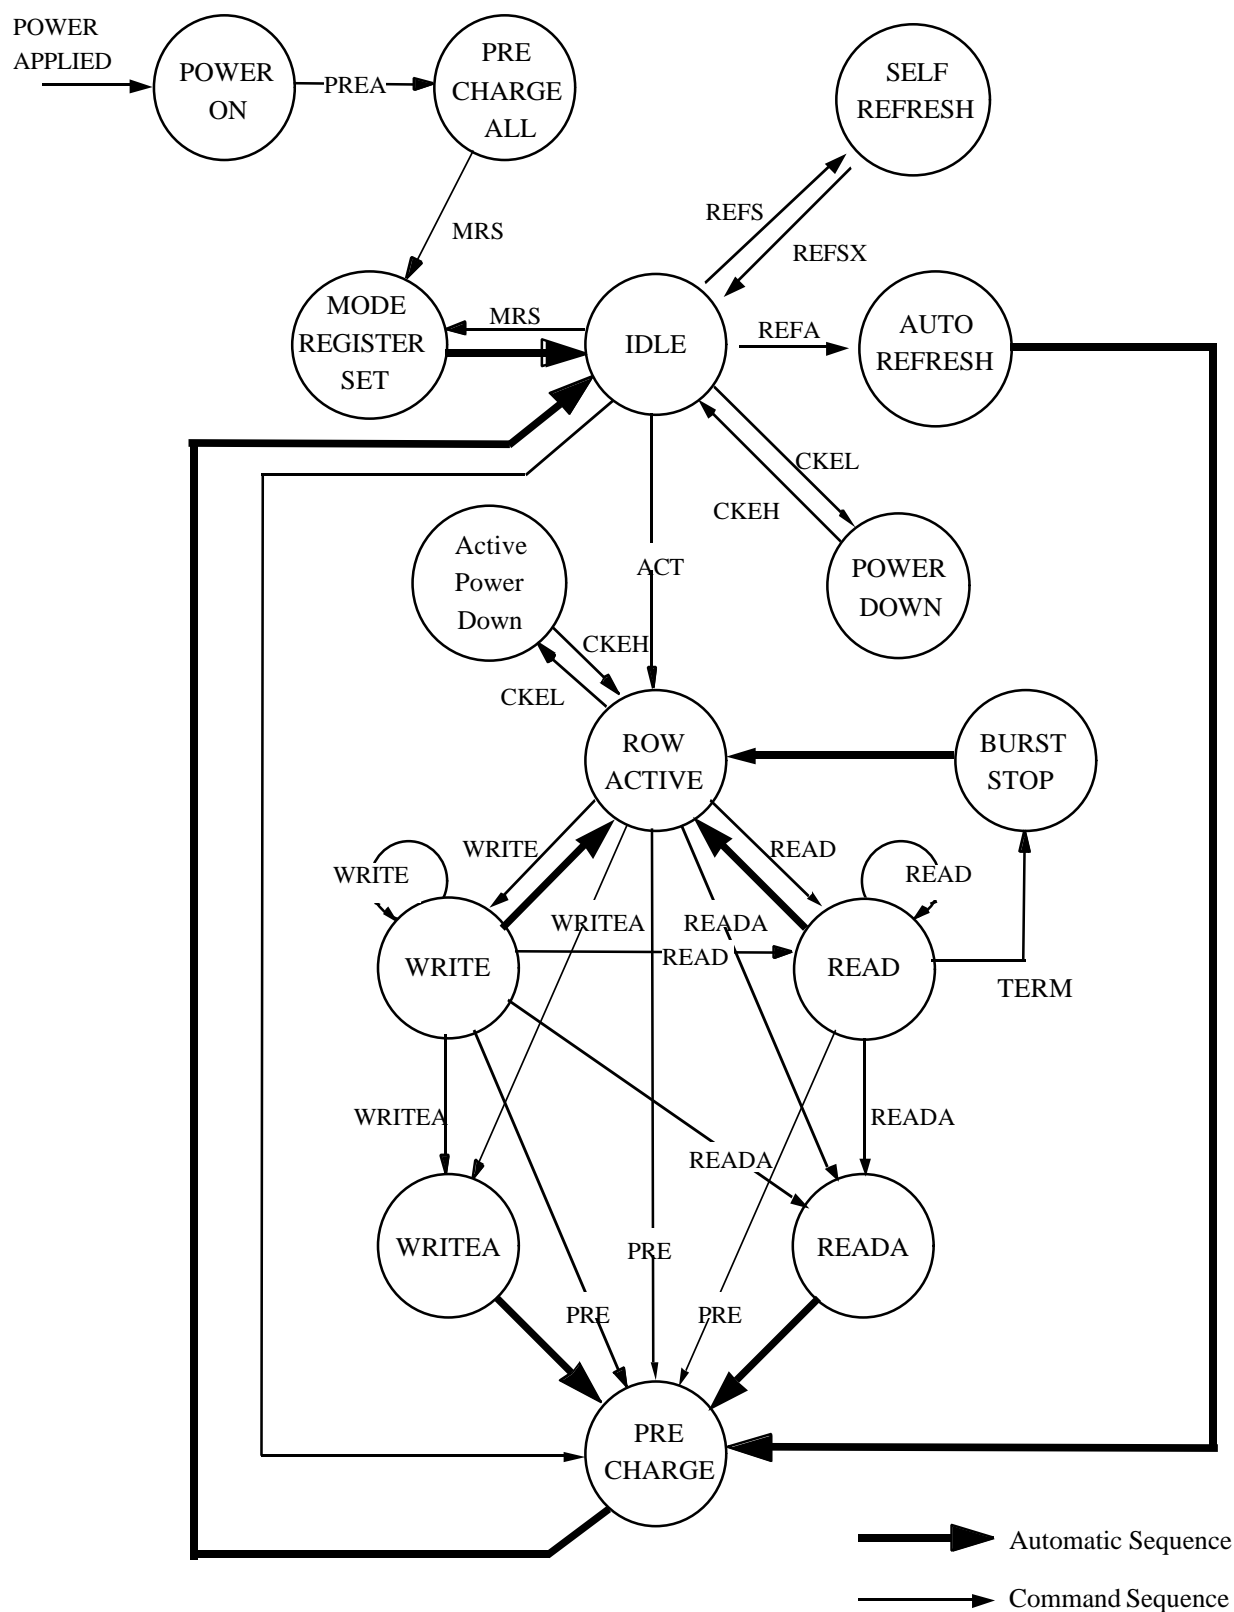

NOTES:

1. Low to High transition of CKE re-enable CLK and other inputs asynchronously.

A minimum setup time must be satisfied before any command except EXIT.

2. Power-Down and Self-Refresh can be entered only from the All Banks Idle State.

3. Must be legal command.

SIMPLIFIED STATE DIAGRAM

POWER ON SEQUENCE

The following power on sequences are necessary to guarantee the proper operations of the DDR SDRAM.

1. Apply VDD before or at the same time as VDDQ
2. Apply VDDQ before or at the same time as VTT & Vref
3. Maintain stable conditions for 200us after stable power and CLK are supplied, assert NOP or DSEL
4. Issue precharge command for all banks of the device
5. Issue EMRS to program proper functions
6. Issue MRS to configure the Mode Register and to reset the DLL
7. Issue 2 or more Auto Refresh commands
8. Maintain stable conditions for 200 cycle

After these sequence, the DDR SDRAM is in the idle state and ready for normal operation.

MODE REGISTER

Burst Length, Burst Type and /CAS Latency can be programmed by configuring the mode register (MRS). The mode register stores these data until the next MRS command, which may be issued when both banks are in idle state. After tRSC from an MRS command, the DDR SDRAM is ready to accept the new command.

	1	Interleaved

R: Reserved for Future Use

EXTENDED MODE REGISTER

DLL disable / enable mode can be programmed in setting the extended mode register (EMRS). The extended mode register stores these data until the next EMRS command, which may be issued when all banks are in idle state. After tMRD from a EMRS command, the DDR SDRAM is ready to accept the new command.

Notes

1. All voltages are referenced to Vss.
2. Tests for AC timing, IDD, and electrical AC and DC characteristics, may be conducted at nominal reference/supply voltage levels, However, the specifications and device operations are guaranteed for the full voltage range specified.
3. AC timing and IDD tests may use the VIL to VIH swing of up to 1.5V in the test environment. Input timing is still referenced to VREF (or to the crossing point for CK//CK), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals is 1V/ns in the range between VIL(AC) and VIH(AC).
4. The AC and DC input level specifications are as defined in the SSTL_2 Standard (i.e. the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above (below) the DC input LOW (HIGH) level.
5. VREF is expected to be equal to $0.5 \cdot V_{ddQ}$ of the transmitting device, and to track variations in the DC level of the same. Peak-to-peak noise on VREF may not exceed $\pm 2\%$ of the DC value.
6. VTT is not applied directly to the device. VTT is a system supply for signal termination resistors, is expected to be set equal to VREF, and must track variations in the DC level of VREF.
7. VID is the magnitude of the difference between the input level on CLK and the input level on /CLK.
8. The value of VIX is expected to equal $0.5 \cdot V_{ddQ}$ of the transmitting device and must track variations in the DC level of the same.
9. Enables on-chip refresh and address counters.
10. IDD specifications are tested after the device is properly initialized.
11. This parameter is sampled. $V_{ddQ} = 2.5V \pm 0.2V$, $V_{dd} = 2.5V \pm 0.2V$, $f = 100\text{ MHz}$, $T_a = 25^\circ\text{C}$, $V_{OUT}(\text{DC}) = V_{ddQ}/2$, $V_{OUT}(\text{PEAK TO PEAK}) = 25\text{mV}$. DM inputs are grouped with I/O pins - reflecting the fact that they are matched in loading (to facilitate trace matching at the board level).
12. The CLK//CLK input reference level (for timing referenced to CLK//CLK) is the point at which CLK and /CLK cross; the input reference level for signals other than CLK//CLK, is VREF.
13. Inputs are not recognized as valid until VREF stabilizes. Exception: during the period before VREF stabilizes, $\text{CKE} \leq 0.3V_{ddQ}$ is recognized as LOW.
14. tHZ and tLZ transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ), or begins driving (LZ).
15. The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
16. The specific requirement is that DQS be valid (HIGH, LOW, or at some point on a valid transition) on or before this CLK edge. A valid transition is defined as monotonic, and satisfies the input slew rate specifications.
When no writes were previously in progress on the bus, DQS will be transitioning from High-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on tDQSS.

Notes (continued)

17. A maximum of eight AUTO REFRESH commands can be asserted to any given DDR SDRAM device.

18. tXPRD should be 200 tCLK when the clocks are unstable during the power down mode.

19. For command/address and CK & /CK slew rate > 1.0V/ns.

20. IDD7 : Operating current is measured under the conditions

(1). Four Bank are being interleaved with tRC(min), burst mode, address and control inputs on NOP edge are not changing, Iout = 0mA

Read Operation

Write Operation / $t_{\text{DQSS}} = \text{max.}$

Write Operation / $t_{\text{DQSS}} = \text{min.}$

OPERATIONAL DESCRIPTION

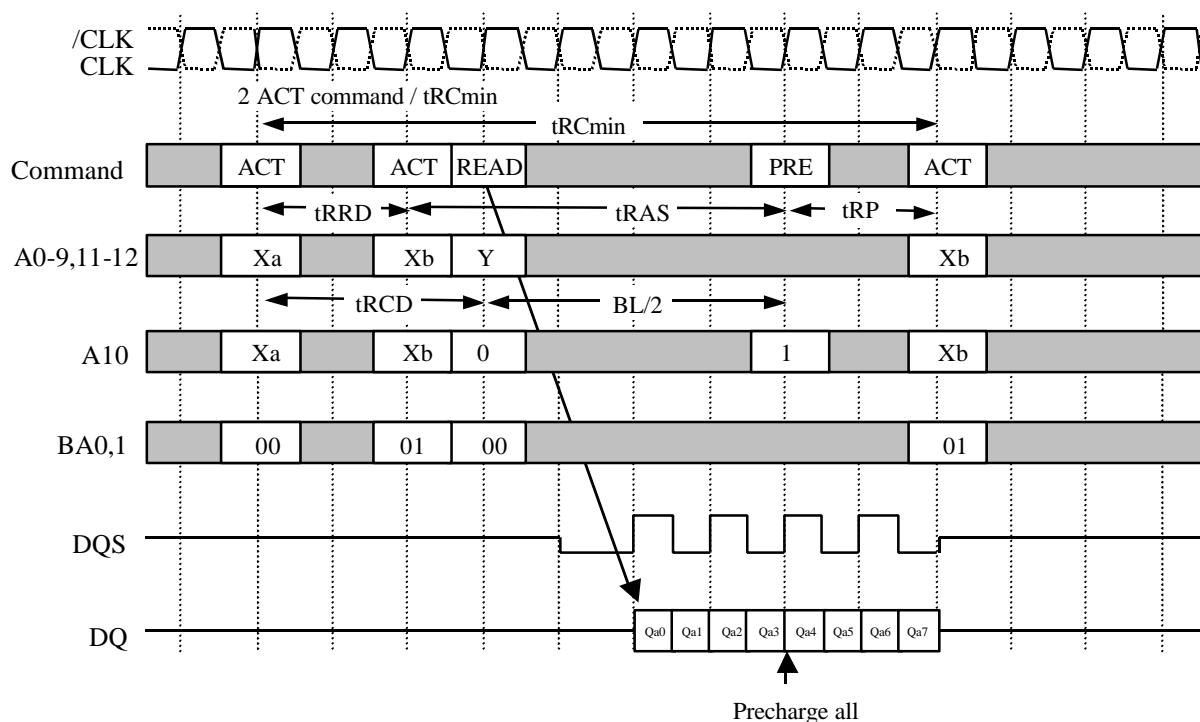

BANK ACTIVATE (ACT)

The DDR SDRAM has four independent banks. Each bank is activated by the ACT command with the bank addresses (BA0,1). A row is indicated by the row address A12-0. The minimum activation interval between banks is t_{RRD} .

PRECHARGE (PRE)

The PRE command deactivates the bank indicated by BA0,1. When multiple banks are active, the precharge all command (PREA, PRE+A10=H) is available to deactivate all banks them at the same time. After t_{RP} from the precharge, an ACT command to the same bank can be issued.

Bank Activation and Precharge All (BL=8, CL=2)

A precharge command can be issued after $BL/2$ time from a read command.

READ

After t_{RCD} from the bank activation, a READ command can be issued. 1st Output data is available after the /CAS Latency from the READ, followed by (BL-1) consecutive data. (BL:Burst Length) The start address is specified by A12-A11,A9-A0(x4)/A11,A9-A0(x8), and the address sequence of burst data is defined by the Burst Type. A READ command may be applied to any active bank, so the row precharge time (t_{RP}) can be hidden during the continuous burst data by interleaving the multiple banks. When A10 is high in READ command, the auto-precharge (READA) is performed. Any command(READ,WRITE,PRE,ACT) asserted to the same bank is inhibited till the internal precharge is completed. The internal precharge operation starts at BL/2 time after READA command. The next ACT command can be issued after (BL/2+ t_{RP}) time from the previous READA.

PCG	Legal	Legal	Legal	Legal	Legal	Legal	Legal	Legal

Operating description when new command is asserted.

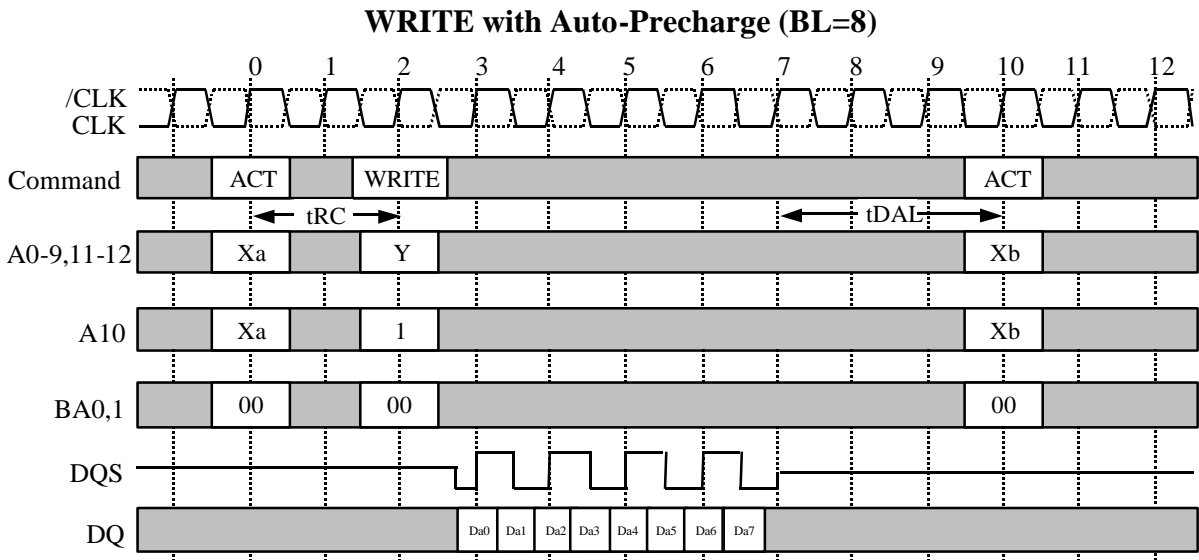

WRITE

After tRCD time from the bank activation, a WRITE command can be issued. 1st input data is sampled at the WRITE command with data strobe input, followed by (BL-1) data being written into RAM. The Burst Length is BL. The start address is specified by A12-A11,A9-A0(x4)/A11,A9-A0(x8), and the address sequence of burst data is defined by the Burst Type. A WRITE command may be applied to any active bank, so the row precharge time (tRP) can be hidden during the continuous input data by interleaving the multiple banks. The write recovery time (tWR) is required from the last written data to the next PRE command. When A10 is high in a WRITE command, the auto-precharge(WRITEA) is performed. Any command(READ,WRITE,PRES,ACT) to the same bank is inhibited till the internal precharge operation is completed. The next ACT command can be issued after tDAL from the last input data cycle.

Operating description when new command is asserted.

BURST INTERRUPTION

[Read Interrupted by Read]

Burst read operation can be interrupted by the new Read command issued to any other bank. Random column access is allowed. READ to READ interval is 1CLK as the minimum.

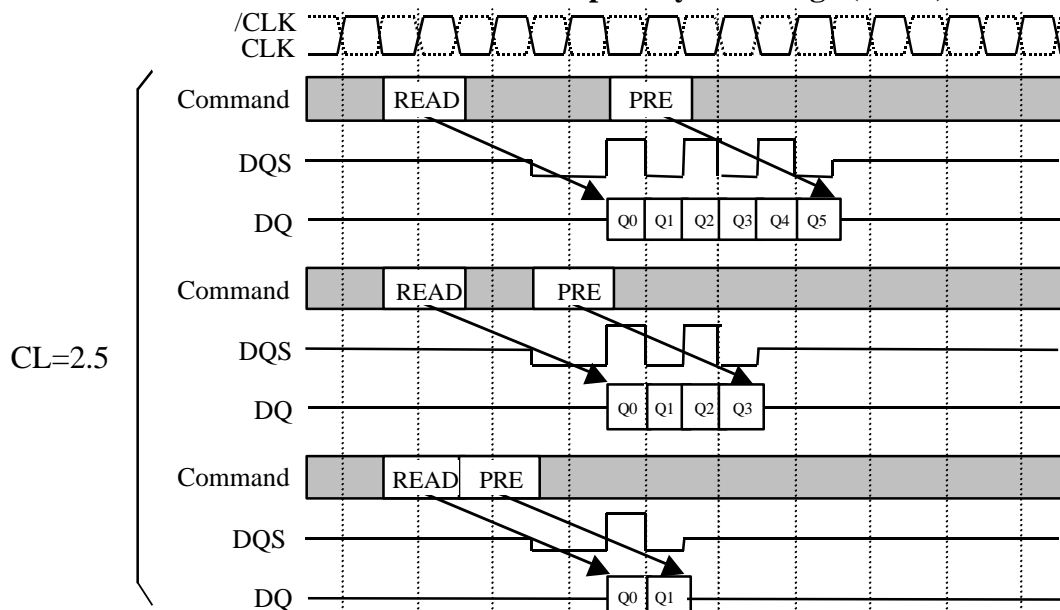

Read Interrupted by Read (BL=8, CL=2)

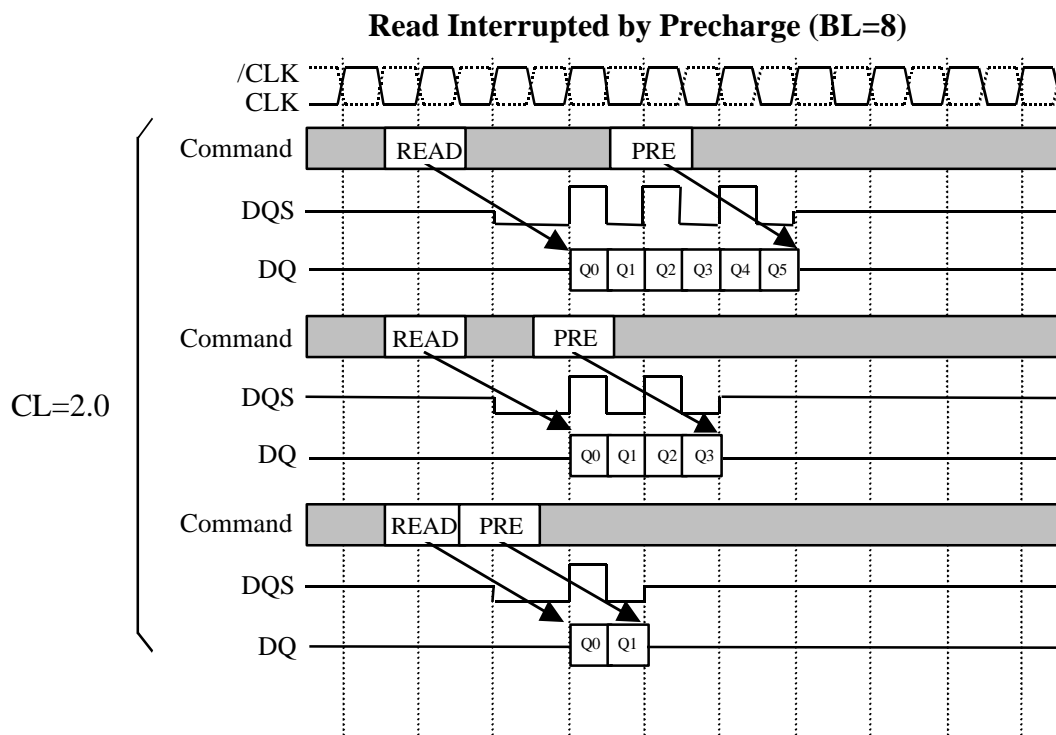

[Read Interrupted by precharge]

Burst read operation can be interrupted by precharge of the same bank. READ to PRE interval is 1 CLK minimum. The time between PRE command to output disable is equal to the CAS Latency. As a result, READ to PRE interval determines valid data length to be outputted. The figure below shows the example of BL=8.

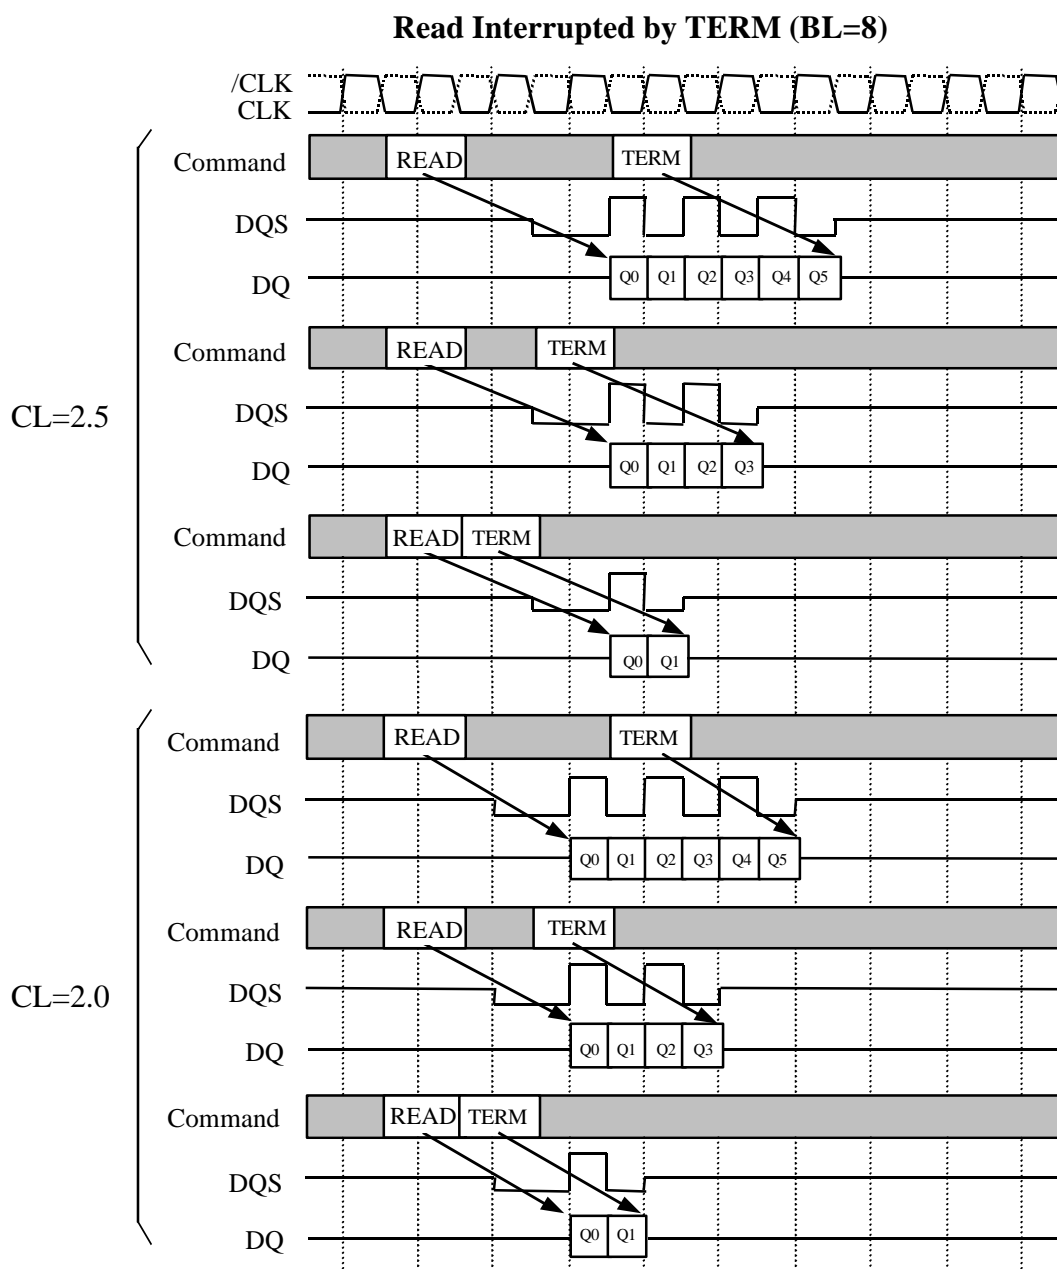

Read Interrupted by Precharge (BL=8)

M2S12D20/ 30TP -75, -75L, -10, -10L
512M Double Data Rate Synchronous DRAM

[Read Interrupted by Burst Stop]

Burst read operation can be interrupted by a burst stop command (TERM). READ to TERM interval is 1 CLK minimum. The time between TERM command to output disable equal to the CAS Latency. As a result, READ to TERM interval determines valid data length to be output. The figure below shows the example of BL=8.

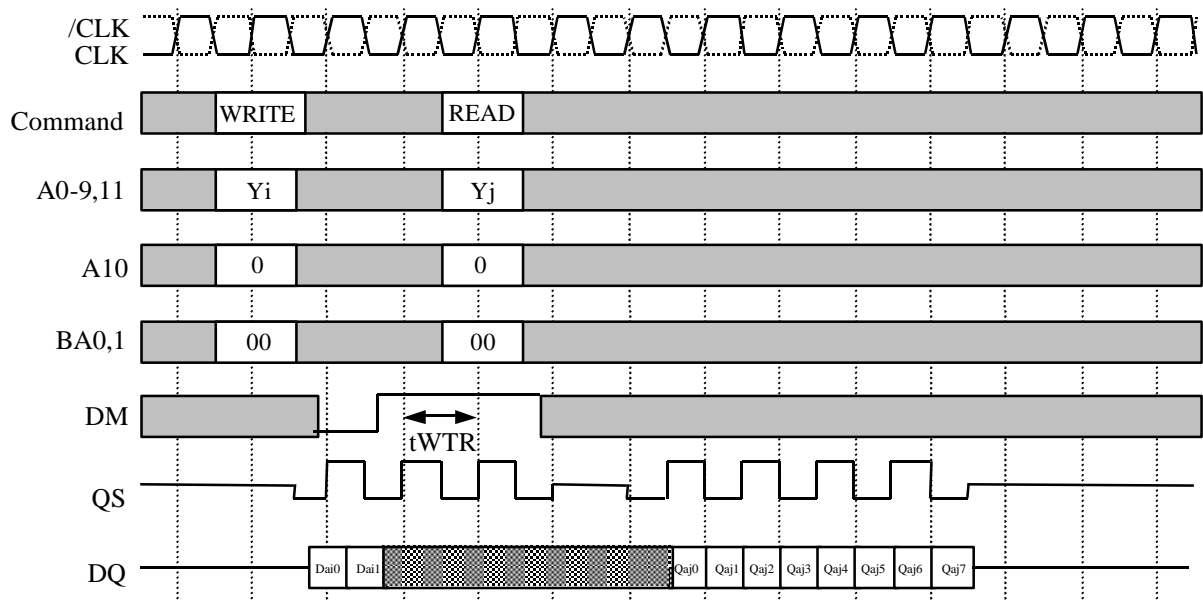

[Read Interrupted by Write with TERM]**Read Interrupted by TERM (BL=8)**

[Write interrupted by Write]

Burst write operation can be interrupted by Write to any bank. Random column access is allowed. WRITE to WRITE interval is 1 CLK minimum.

Write Interrupted by Write (BL=8)

[Write interrupted by Read]

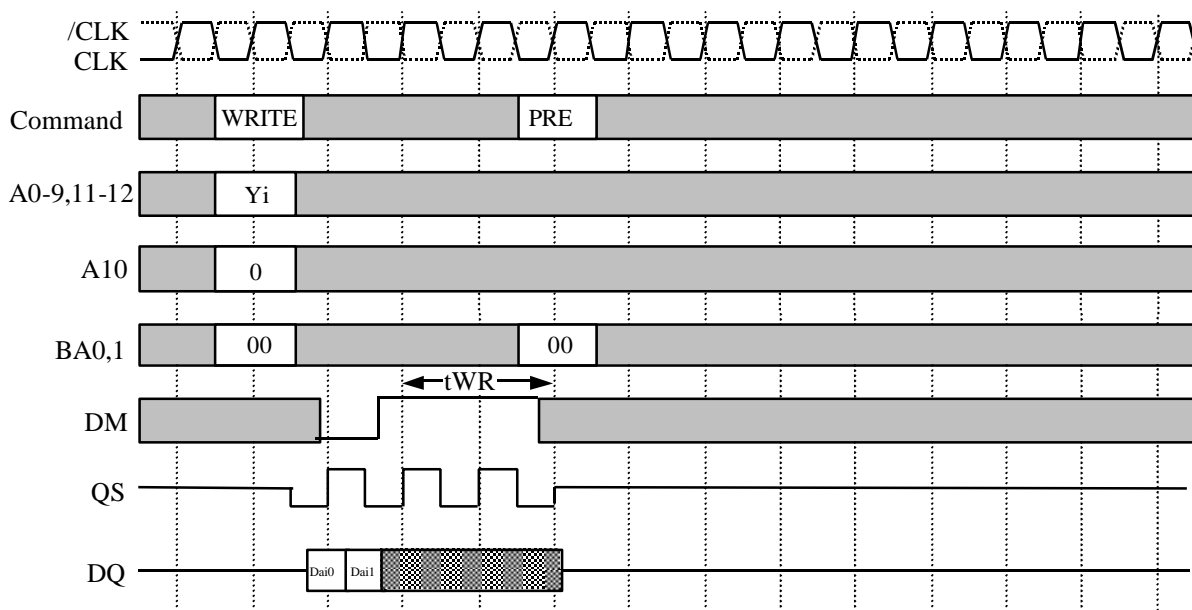

Burst write operation can be interrupted by read of the same or the other bank. Random column access is allowed. Internal WRITE to READ command interval (t_{WTR}) is 1 CLK minimum. The input data masked by DM in the interrupted READ cycle is "don't care". t_{WTR} is referenced from the first positive edge after the last data input.

Write Interrupted by Read (BL=8, CL=2.5)

[Write interrupted by Precharge]

Burst write operation can be interrupted by precharge of the same or all bank. Random column access is allowed. tWR is referenced from the first positive CLK edge after the last data input.

Write Interrupted by Precharge (BL=8, CL=2.5)

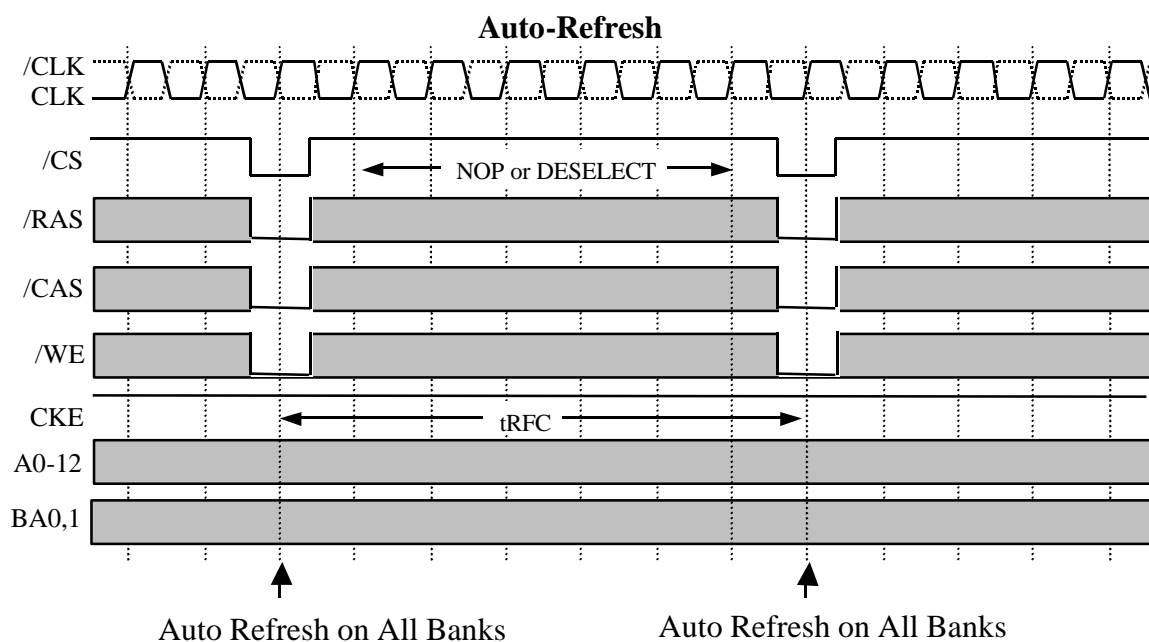

[Initialize and Mode Register sets]

[AUTO REFRESH]

Auto-refresh cycle is initiated with a REFA(/CS=/RAS=/CAS=L,/WE=CKE=H) command. The refresh address is generated internally. 8192 REFA cycles within 64 ms refresh 512 Mbits memory cells. The auto-refresh is performed on 4 banks concurrently. Before performing an auto refresh, all banks must be in the idle state. The minimum interval between auto-refreshes is tRFC. No command is allowed within tRFC time after the REFA command.

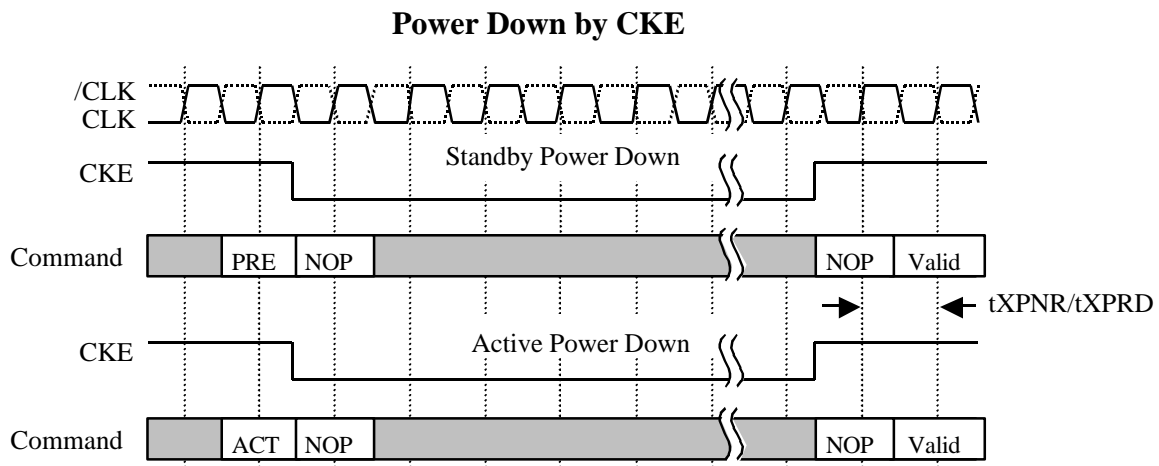

[SELF REFRESH]

Self-refresh mode is entered by asserting a REFS command ($\overline{\text{CS}}=\overline{\text{RAS}}=\overline{\text{CAS}}=\text{L}, \overline{\text{WE}}=\text{H}, \text{CKE}=\text{L}$). The self-refresh mode is maintained as long as CKE is kept low. During the self-refresh mode, CKE becomes asynchronous and the only enable input. All other inputs including CLK are disabled and ignored to save the power consumption. In order to exit the self-refresh mode, the device shall be supplied the stable CLK input, followed by DESEL or NOP command, then asserting CKE for the period longer than $t_{\text{XSNR}}/t_{\text{XSRD}}$.

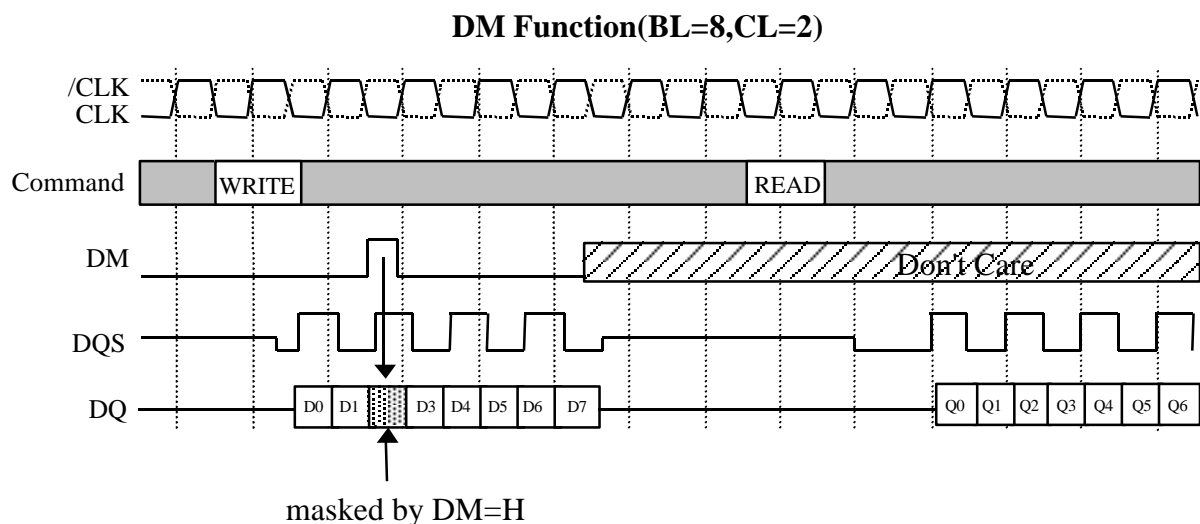

[Power DOWN]

The purpose of CLK suspend is power down. CKE is synchronous input except during the self-refresh mode. A command at cycle is ignored. From CKE=H to normal function, DLL recovery time is NOT required when the stable CLK is supplied during the power down mode.

**[DM CONTROL]**

DM is defined as the data mask for write data. During the writes, DM masks the input data cycle by cycle. Latency of DM to write mask is 0.

Keep safety first in your circuit designs!

Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.

Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.

All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.

The information described here may contain technical inaccuracies or typographical errors. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.

Please also pay attention to information published by Mitsubishi Electric Corporation by various means, including the Mitsubishi Semiconductor home page (<http://www.mitsubishichips.com>).

When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.

Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.

The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.

If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.

Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.

Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.

Revision History

Rev. 1.0 Nov '01

-New registration

Rev. 1.1 Jan '02

-Added -75L,-10L spec.

-Added WRITEA and READA operating description table when new command asserted

-Deleted -75A spec.

-Added AC overshoot and overshoot spec.

-Changed the average supply current from Vdd spec.
