

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

1. DESCRIPTION

The M37212M6-XXXSP/FP, M37212M4/M8-XXXSP are single-chip microcomputers designed with CMOS silicon gate technology. They have a OSD, I²C-BUS interface, and PWM, so it is useful for a channel selection system for TV.

The feature of the M37212EFSP/FP are similar to those of the M37212M6-XXXSP/FP except that these chips have a built-in PROM which can be written electrically. The differences between the M37212M6-XXXSP/FP and M37212M4/M8-XXXSP are the ROM size and the RAM size as shown below. Accordingly, the following descriptions will be for M37212M6-XXXSP/FP unless otherwise noted.

2. FEATURES

- Number of basic instructions 71
- Memory size
 - ROM..... 16K bytes (M37212M4-XXXSP)
 - 24K bytes (M37212M6-XXXSP/FP)
 - 32K bytes (M37212M8-XXXSP)
 - 62K bytes (M37212EFSP/FP)
 - RAM 320 bytes (M37212M4-XXXSP)
 - 384 bytes (M37212M6-XXXSP/FP)
 - 576 bytes (M37212M8-XXXSP)
 - 1280 bytes (M37212EFSP/FP)
 - (*ROM correction memory included)
- The minimum instruction execution time
 - 0.5 μ s (at 8 MHz oscillation frequency)
- Power source voltage 5 V \pm 10 %
- Subroutine nesting
 - maximum 96 levels (M37212M4/M8-XXXSP, M37212M6-XXXSP/FP)
 - maximum 128 levels (M37212EFSP/FP)
- Interrupts 14 types, 14 vectors
- 8-bit timers 4
- Programmable I/O ports
 - (Ports P0, P10-P14, P2, P30, P31, P40, P41) 25
- Input ports (Ports P15-P17, P32-P37, P42) 10
- Output ports (Ports P52-P55, P60-P63) 8
- 12 V withstand ports 12
- LED drive ports 4
- Serial I/O 8-bit \times 1 channel
- Multi-master I²C-BUS interface 1 (2 systems)
- A-D comparator (6-bit resolution) 8 channels
- PWM output circuit 14-bit \times 1, 8-bit \times 8
- Power dissipation 165 mW
 - (at 8 MHz oscillation frequency, V_{CC}=5.5V, at OSD display)
- ROM correction function 2 vectors
 - Note:** Only M37212M8-XXXSP and M37212EFSP/FP have ROM correction function.

●OSD function

- Display characters 24 characters \times 2 lines
(It is possible to display 3lines or more by software)
- Kinds of characters 256 kinds
- Character display area 12 \times 16 dots
- Kinds of character sizes 3 kinds
- Kinds of character colors 8 colors (R, G, B)
- Coloring unit character, character background, raster
- Display position
 - Horizontal: 64 levels
 - Vertical: 128 levels
- Attribute border

3. APPLICATION

6. PERFORMANCE OVERVIEW

Table 6.1 Performance Overview

Parameter			Functions
Number of basic instructions			71
Number of basic instructions			0.5 μ s (the minimum instruction execution time, at 8 MHz oscillation frequency)
Instruction execution time			8 MHz (maximum)
Memory size	ROM	M37212M4-XXXSP	16K bytes
		M37212M6-XXXSP/FP	24K bytes
		M37212M8-XXXSP	32K bytes
		M37212EFSP/FP	62K bytes
	RAM	M37212M4-XXXSP	320 bytes
		M37212M6-XXXSP/FP	384 bytes
		M37212M8-XXXSP	576 bytes (ROM correction memory included)
		M37212EFSP/FP	1280 bytes (ROM correction memory included)
	OSD ROM		8 K bytes
	OSD RAM		96 bytes
Input/Output ports	P0	I/O	8-bit X 1 (N-channel open-drain output structure, can be used as PWM output pins)
	P10-P14	I/O	5-bit X 1 (CMOS input/output structure, however, N-channel open-drain output structure, when P11-P14 are used as multi-master I ² C-BUS interface, can be used as OSD output, A-D input, multi-master I ² C-BUS interface)
	P15-P17	Input	3-bit X 1 (can be used as INT input pin, A-D input pins)
	P20-P27	I/O	8-bit X 1 (CMOS input/output structure)
	P30, P31	I/O	2-bit X 1 (CMOS input/output structure)
	P32-P37	Input	6-bit X 1 (can be used as external clock input pins, INT input pins, OSD display clock I/O pins, A-D input pins)
	P40, P41	I/O	2-bit X 1 (N-channel open-drain output structure, can be used as serial I/O pins, A-D input pins)
	P42	Input	1-bit X 1 (can be used as serial input pin, A-D input pin)
	P52-P55	Output	4-bit X 1 (CMOS output structure, can be used as OSD output pins)
	P60-P63	Output	4-bit X 1 (N-channel open-drain output structure, can be used as PWM output pins)
Serial I/O			8-bit X 1
Multi-master I ² C-BUS interface			1 (2 systems)
A-D comparator			8 channels (6-bit resolution)
PWM output circuit			14-bit X 1, 8-bit X 8
Timers			8-bit timer X 4
Subroutine nesting			96 levels (maximum)
Interrupt			<14 sources> INT external interrupt X 3, Internal timer interrupt X 4, Serial I/O interrupt X 1, OSD interrupt X 1, Multi-master I ² C-BUS interface interrupt X 1, f(XIN)/4096 interrupt X 1, VSYNC interrupt X 1, BRK interrupt X 1, Reset X 1
Clock generating circuit			2 built-in circuits (externally connected a ceramic resonator or a quartz-crystal oscillator)

7. PIN DESCRIPTION

Table 7.1 Pin Description

Pin	Name	Input/ Output	Functions
VCC, Vss.	Power source		Apply voltage of 5 V \pm 10 % to (typical) VCC, and 0 V to Vss.
CNVss	CNVss		This is connected to Vss.
RESET	Reset input	Input	To enter the reset state, the reset input pin must be kept at a "L" for 2 μ s or more (under normal VCC conditions). If more time is needed for the quartz-crystal oscillator to stabilize, this "L" condition should be maintained for the required time.
XIN	Clock input	Input	This chip has an internal clock generating circuit. To control generating frequency, an external ceramic resonator or a quartz-crystal oscillator is connected between pins XIN and XOUT. If an external clock is used, the clock source should be connected to the XIN pin and the XOUT pin should be left open.
XOUT	Clock output	Output	
P00/PWM4– P03/PWM7, P04–P07	I/O port P0	I/O	Port P0 is an 8-bit I/O port with direction register allowing each I/O bit to be individually programmed as input or output. At reset, this port is set to input mode. The output structure is N-channel open-drain output. (See note)
	PWM output	Output	Pins P00–P03 are also used as PWM output pins PWM4–PWM7 respectively. The output structure is N-channel open-drain output.
P10/OUT2/ A-D8, P11/SCL1, P12/SCL2, P13/SDA1, P14/SDA2	I/O port P1	I/O	Port P10–P14 are a 5-bit I/O port and has basically the same functions as port P0. The output structure is CMOS output.
	OSD output	Output	Pins P10 is also used as OSD output pin OUT2. The output structure is CMOS output.
	Multi-master I ² C-BUS interface	I/O	Pins P11–P14 are used as SCL1, SCL2, SDA1 and SDA2 respectively, when multi-master I ² C-BUS interface is used. The output structure is N-channel open-drain output.
	Analog input	Input	P10 pin is also used as analog input pin A-D8.
P15/INT3/ A-D1, P16/A-D2, P17/A-D3	Input port P1	Input	Port P15–P17 are a 3-bit input port and has basically the same functions as port P0.
	Analog input	Input	Pins P15–P17 are also used as analog input pins A-D1 to A-D3 respectively.
	External interrupt input	Input	P15 pin is also used as INT external interrupt input pin INT3.
P20–P27	I/O port P2	I/O	Port P2 is an 8-bit I/O port and has basically the same functions as port P0. The output structure is CMOS output. (See note)
P30, P31	I/O port P3	I/O	Ports P30, P31 are a 2-bit I/O port and has basically the same functions as port P0. The output structure is CMOS output.
P32/TIM2, P33/TIM3, P34/INT1, P35/INT2/ A-D4, P36/OSC1, P37/OSC2	Input port P3	Input	Ports P32–P37 are a 6-bit input port and has basically the same functions as port P0.
	External clock input	Input	Pins P32, P33 are also used as external clock input pins TIM2, TIM3 respectively.
	External interrupt input	Input	Pins P34, P35 are also used as INT external interrupt input pins INT1, INT2 respectively.
	Analog input	Input	P35 pin is also used as analog input pin A-D4.
	Clock input for OSD display	Input	P36 pin is also used as OSD display clock input pin OSC1.
	Clock output for OSD display	Output	P37 pin is also used as OSD display clock output pin OSC2. The output structure is CMOS output.

Table 7.2 Pin Description (continued)

Pin	Name	Input/ Output	Functions
P40/SOUT(IIN)/ A-D7, P41/SCLK/ A-D6,	I/O port P4	I/O	Ports P40, P41 are a 2-bit I/O port and has basically the same functions as port P0. The output structure is N-channel open-drain output.
	Serial I/O data input/output	I/O	Pin P40 is also used as serial I/O data input/output pin SOUT(IIN). The output structure is N-channel open-drain output.
	Serial I/O synchronizing clock input/output	I/O	Pin P41 is also used as serial I/O synchronizing clock input/output pin SCLK. The output structure is N-channel open-drain output.
	Analog input pin	Input	Pin P40, P41 are also used as analog input pins A-D7, A-D6 respectively.
P42/SIN/ A-D5,	Input port P4	Input	Port P42 is a 1-bit input port and has basically the same functions as port P0.
	Serial I/O data input	Input	Pin P42 is also used as serial I/O data input pin SIN.
	Analog input	Input	Pin P42 is also used as analog input pin A-D5.
P52/R, P53/G, P54/B, P55/OUT1	Output port P5	Output	Ports P52–P55 are a 4-bit output port and has basically the same functions as port P0. The output structure is CMOS output.
	OSD output	Output	Pins P52–P55 are also used as OSD output pins R, G, B, OUT1 respectively. The output structure is CMOS output.
P60PWM0– P63/PWM3	Output port P6	Output	Ports P60–P63 are a 4-bit I/O port and has basically the same functions as port P0. The output structure is N-channel open-drain output.
	PWM output	Output	Pins P60–P63 are also used as PWM output pins PWM0–PWM3 respectively. The output structure is N-channel open-drain output.
HSYNC	HSYNC input	Input	This is a horizontal synchronizing signal input for OSD.
VSYSN	VSYSN input	Input	This is a vertical synchronizing signal input for OSD.
DA	DA output	Output	This is a 14-bit PWM output pin.

Note : Port Pi (i = 0 to 3) has the port Pi direction register which can be used to program each bit as an input ("0") or an output ("1"). The pins programmed as "1" in the direction register are output pins. When pins are programmed as "0," they are input pins. When pins are programmed as output pins, the output data are written into the port latch and then output. When data is read from the output pins, the output pin level is not read but the data of the port latch is read. This allows a previously-output value to be read correctly even if the output "L" voltage has risen, for example, because a light emitting diode was directly driven. The input pins are in the floating state, so the values of the pins can be read. When data is written into the input pin, it is written only into the port latch, while the pin remains in the floating state.

8. FUNCTIONAL DESCRIPTION
8.1 CENTRAL PROCESSING UNIT (CPU)

This microcomputer uses the standard 740 Family instruction set. Refer to the table of 740 Family addressing modes and machine instructions or the SERIES 740 <Software> User's Manual for details on the instruction set.

Machine-resident 740 Family instructions are as follows:

The FST, SLW instruction cannot be used.

The MUL, DIV, WIT and STP instructions can be used.

8.1.1 CPU Mode Register

The CPU mode register contains the stack page selection bit and internal system clock selection bit. The CPU mode register is allocated at address 00FB16.

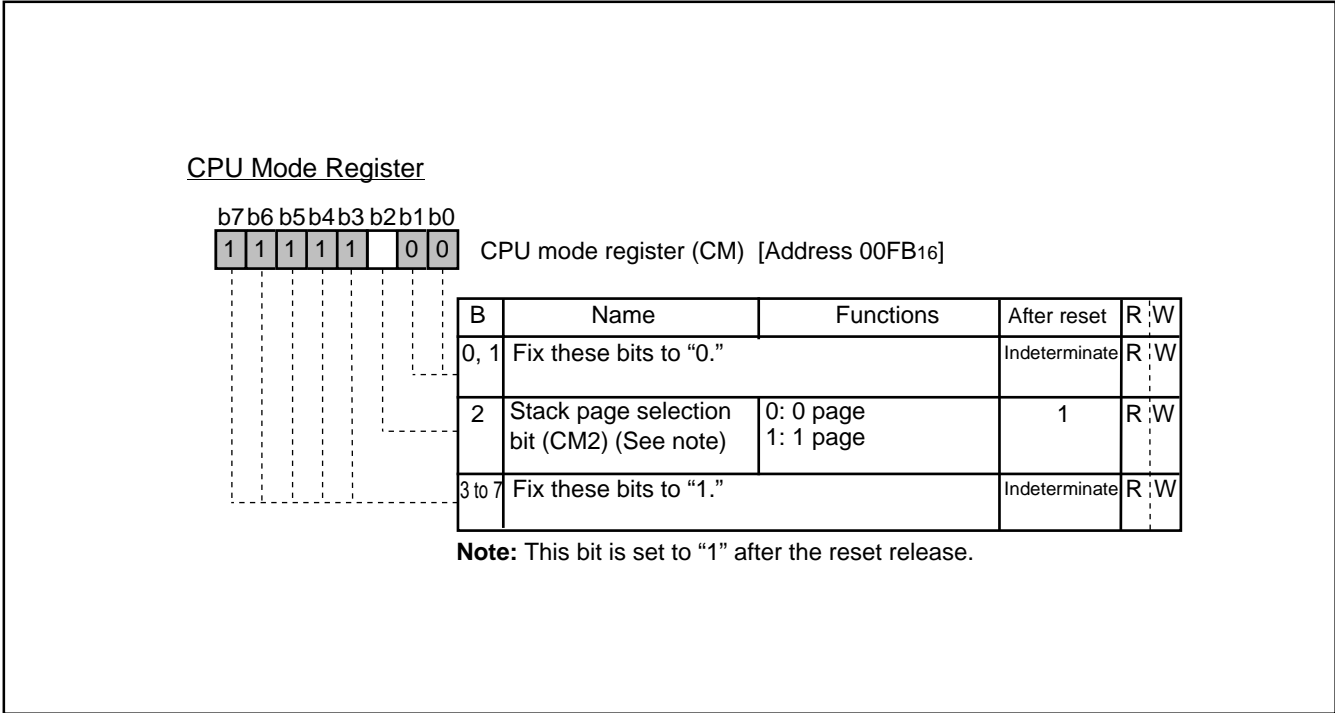

Fig. 8.1.1 CPU Mode Register

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER

8.2 MEMORY

8.2.1 Special Function Register (SFR) Area

The special function register (SFR) area in the zero page contains control registers such as I/O ports and timers.

8.2.2 RAM

RAM is used for data storage and for stack area of subroutine calls and interrupts.

8.2.3 ROM

ROM is used for storing user programs as well as the interrupt vector area.

8.2.4 OSD RAM

RAM for display is used for specifying the character codes and colors to display.

8.2.5 OSD ROM

ROM for display is used for storing character data.

8.2.6 Interrupt Vector Area

The interrupt vector area contains reset and interrupt vectors.

8.2.7 Zero Page

The 256 bytes from addresses 0000₁₆ to 00FF₁₆ are called the zero page area. The internal RAM and the special function registers (SFR) are allocated to this area.

The zero page addressing mode can be used to specify memory and register addresses in the zero page area. Access to this area with only 2 bytes is possible in the zero page addressing mode.

8.2.8 Special Page

The 256 bytes from addresses FF00₁₆ to FFFF₁₆ are called the special page area. The special page addressing mode can be used to specify memory addresses in the special page area. Access to this area with only 2 bytes is possible in the special page addressing mode.

8.2.9 ROM Correction Memory (RAM)

This is used as the program area for ROM correction.

Note: Only M37212M8-XXXSP and M37212EFSP/FP have ROM correction memory.

8.3 INTERRUPTS

Interrupts can be caused by 14 different sources consisting of 4 external, 8 internal, 1 software, and reset. Interrupts are vectored interrupts with priorities as shown in Table 8.3.1. Reset is also included in the table because its operation is similar to an interrupt.

When an interrupt is accepted,

- ① The contents of the program counter and processor status register are automatically stored into the stack.
- ② The interrupt disable flag I is set to "1" and the corresponding interrupt request bit is set to "0."
- ③ The jump destination address stored in the vector address enters the program counter.

Other interrupts are disabled when the interrupt disable flag is set to "1."

All interrupts except the BRK instruction interrupt have an interrupt request bit and an interrupt enable bit. The interrupt request bits are in interrupt request registers 1 and 2 and the interrupt enable bits are in interrupt control registers 1 and 2. Figures 8.3.2 to 8.3.6 show the interrupt-related registers.

Interrupts other than the BRK instruction interrupt and reset are accepted when the interrupt enable bit is "1," interrupt request bit is "1," and the interrupt disable flag is "0." The interrupt request bit can be set to "0" by a program, but not set to "1." The interrupt enable bit can be set to "0" and "1" by a program.

Reset is treated as a non-maskable interrupt with the highest priority.

Figure 8.3.1 shows interrupt control.

8.3.1 Interrupt Causes

(1) VSYNC, OSD interrupts

The VSYNC interrupt is an interrupt request synchronized with the vertical sync signal.

The OSD interrupt occurs after character block display to the CRT is completed.

(2) INT1 to INT3 external interrupts

The INT1 to INT3 interrupts are external interrupt inputs, the system detects that the level of a pin changes from LOW to HIGH or from HIGH to LOW, and generates an interrupt request. The input active edge can be selected by bits 3 to 5 of the interrupt input polarity register (address 00F9₁₆) : when this bit is "0," a change from LOW to HIGH is detected; when it is "1," a change from HIGH to LOW is detected. Note that both bits are cleared to "0" at reset.

(3) Timers 1 to 4 interrupts

An interrupt is generated by an overflow of timers 1 to 4.

Table 8.3.1 Interrupt Vector Addresses and Priority

Priority	Interrupt Source	Vector Addresses	Remarks
1	Reset	FFFF ₁₆ , FFFE ₁₆	Non-maskable
2	OSD interrupt	FFFD ₁₆ , FFFC ₁₆	
3	INT2 external interrupt	FFFB ₁₆ , FFFA ₁₆	Active edge selectable
4	INT1 external interrupt	FFF9 ₁₆ , FFF8 ₁₆	Active edge selectable
5	Timer 4 interrupt	FFF5 ₁₆ , FFF4 ₁₆	
6	f(XIN)/4096 interrupt	FFF3 ₁₆ , FFF2 ₁₆	
7	VSYNC interrupt	FFF1 ₁₆ , FFF0 ₁₆	
8	Timer 3 interrupt	FFEF ₁₆ , FFEE ₁₆	
9	Timer 2 interrupt	FFED ₁₆ , FFEC ₁₆	
10	Timer 1 interrupt	FFEB ₁₆ , FFEA ₁₆	
11	Serial I/O interrupt	FFE9 ₁₆ , FFE8 ₁₆	
12	Multi-master I ² C-BUS interface interrupt	FFE7 ₁₆ , FFE6 ₁₆	
13	INT3 external interrupt	FFE5 ₁₆ , FFE4 ₁₆	Active edge selectable
14	BRK instruction interrupt	FFDF ₁₆ , FFDE ₁₆	Non-maskable

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

(4) Serial I/O interrupt

This is an interrupt request from the clock synchronous serial I/O function.

(5) $f(X_{IN})/4096$ interrupt

The $f(X_{IN})/4096$ interrupt occurs regularly with a $f(X_{IN})/4096$ period. Set bit 0 of PWM output control register 1 to "0."

(6) Multi-master I²C-BUS interface interrupt

This is an interrupt request related to the multi-master I²C-BUS interface.

(7) BRK instruction interrupt

This software interrupt has the least significant priority. It does not have a corresponding interrupt enable bit, and it is not affected by the interrupt disable flag I (non-maskable).

8.4 TIMERS

This microcomputer has 4 timers: timers 1 to 4. All timers are 8-bit timers with the 8-bit timer latch. The timer block diagram is shown in Figure 8.4.3.

All of the timers count down and their divide ratio is $1/(n+1)$, where n is the value of timer latch. By writing a count value to the corresponding timer latch (addresses 00F0₁₆ to 00F3₁₆: timers 1 to 4), the value is also set to a timer, simultaneously.

The count value is decremented by 1. The timer interrupt request bit is set to "1" by a timer overflow at the next count pulse, after the count value reaches "00₁₆."

8.4.1 Timer 1

Timer 1 can select one of the following count sources:

- $f(XIN)/16$
- $f(XIN)/4096$

The count source of timer 1 is selected by setting bit 0 of timer 12 mode register 1 (address 00F4₁₆).

Timer interrupt request occurs at timer 1 overflow.

8.4.2 Timer 2

Timer 2 can select one of the following count sources:

- $f(XIN)/16$
- Timer 1 overflow signal
- External clock from the TIM2 pin

The count source of timer 2 is selected by setting bits 4 and 1 of timer 12 mode register (address 00F4₁₆). When timer 1 overflow signal is a count source for the timer 2, the timer 1 functions as an 8-bit prescaler.

Timer 2 interrupt request occurs at timer 2 overflow.

8.4.3 Timer 3

Timer 3 can select one of the following count sources:

- $f(XIN)/16$
- External clock from the HSYNC pin
- External clock from the TIM3 pin

The count source of timer 3 is selected by setting bits 5 and 0 of timer 34 mode register (address 00F5₁₆).

Timer 3 interrupt request occurs at timer 3 overflow.

8.4.4 Timer 4

Timer 4 can select one of the following count sources:

- $f(XIN)/16$
- $f(XIN)/2$
- Timer 3 overflow signal

The count source of timer 3 is selected by setting bits 1 and 4 of timer 34 mode register (address 00F5₁₆). When timer 3 overflow signal is a count source for the timer 4, the timer 3 functions as an 8-bit prescaler.

Timer 4 interrupt request occurs at timer 4 overflow.

At reset, timers 3 and 4 are connected by hardware and "FF₁₆" is automatically set in timer 3; "07₁₆" in timer 4. The $f(XIN)/16$ is selected as the timer 3 count source. The internal reset is released by timer 4 overflow in this state and the internal clock is connected.

At execution of the STP instruction, timers 3 and 4 are connected by hardware and "FF₁₆" is automatically set in timer 3; "07₁₆" in timer 4. However, the $f(XIN)/16$ is not selected as the timer 3 count source. So set both bit 0 of timer 34 mode register (address 00F5₁₆) and bit 6 at address 00C7₁₆ to "0" before execution of the STP instruction ($f(XIN)/16$ is selected as the timer 3 count source). The internal STP state is released by timer 4 overflow in this state and the internal clock is connected.

As a result of the above procedure, the program can start under a stable clock.

The timer-related registers is shown in Figures 8.4.1 and 8.4.2.

8.5 SERIAL I/O

This microcomputer has a built-in serial I/O which can either transmit or receive 8-bit data serially in the clock synchronous mode.

The serial I/O block diagram is shown in Figure 8.5.1. The synchronous clock I/O pin (SCLK), data output pin (SOUT), and data input pin (SIN) also functions as port P4.

Bit 3 of the serial I/O mode register (address 00DC16) selects whether the synchronous clock is supplied internally or externally (from the SCLK pin). When an internal clock is selected, bits 1 and 0 select whether $f(XIN)$ or $f(XCIN)$ is divided by 4, 16, 32, or 64. To use SIN pin for serial I/O, set the corresponding bit of the port P2 direction register (address 00C516) to "0."

The operation of the serial I/O is described below. The operation of the serial I/O differs depending on the clock source; external clock or internal clock.

Fig. 8.5.1 Serial I/O Block Diagram

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

Internal clock : The serial I/O counter is set to "7" during the write cycle into the serial I/O register (address 00DD16), and the transfer clock goes HIGH forcibly. At each falling edge of the transfer clock after the write cycle, serial data is output from the SOUT pin. Transfer direction can be selected by bit 5 of the serial I/O mode register. At each rising edge of the transfer clock, data is input from the SIN pin and data in the serial I/O register is shifted 1 bit.

After the transfer clock has counted 8 times, the serial I/O counter becomes "0" and the transfer clock stops at HIGH. At this time the interrupt request bit is set to "1."

External clock : The an external clock is selected as the clock source, the interrupt request is set to "1" after the transfer clock has been counted 8 counts. However, transfer operation does not stop, so the clock should be controlled externally. Use the external clock of 1 MHz or less with a duty cycle of 50%.

The serial I/O timing is shown in Figure 8.5.2. When using an external clock for transfer, the external clock must be held at HIGH for initializing the serial I/O counter. When switching between an internal clock and an external clock, do not switch during transfer. Also, be sure to initialize the serial I/O counter after switching.

Notes 1: On programming, note that the serial I/O counter is set by writing to the serial I/O register with the bit managing instructions, such as SEB and CLB.

2: When an external clock is used as the synchronous clock, write transmit data to the serial I/O register when the transfer clock input level is HIGH.

8.6 MULTI-MASTER I²C-BUS INTERFACE

The multi-master I²C-BUS interface is a serial communications circuit, conforming to the Philips I²C-BUS data transfer format. This interface, offering both arbitration lost detection and a synchronous functions, is useful for the multi-master serial communications. Figure 8.6.1 shows a block diagram of the multi-master I²C-BUS interface and Table 8.6.1 shows multi-master I²C-BUS interface functions.

This multi-master I²C-BUS interface consists of the I²C address register, the I²C data shift register, the I²C clock control register, the I²C control register, the I²C status register and other control circuits.

Table 8.6.1 Multi-master I²C-BUS Interface Functions

Item	Function
Format	In conformity with Philips I ² C-BUS standard: 10-bit addressing format 7-bit addressing format High-speed clock mode Standard clock mode
Communication mode	In conformity with Philips I ² C-BUS standard: Master transmission Master reception Slave transmission Slave reception
SCL clock frequency	16.1 kHz to 400 kHz (at $\phi = 4$ MHz)

ϕ : System clock = $f(XIN)/2$

Note : We are not responsible for any third party's infringement of patent rights or other rights attributable to the use of the control function (bits 6 and 7 of the I²C control register at address 00DA16) for connections between the I²C-BUS interface and ports (SCL1, SCL2, SDA1, SDA2).

Fig. 8.6.1 Block Diagram of Multi-master I²C-BUS Interface

with ON-SCREEN DISPLAY CONTROLLER

8.6.1 I²C Data Shift Register

The I²C data shift register (S0 : address 00D7₁₆) is an 8-bit shift register to store receive data and write transmit data.

When transmit data is written into this register, it is transferred to the outside from bit 7 in synchronization with the SCL clock, and each time one-bit data is output, the data of this register are shifted one bit to the left. When data is received, it is input to this register from bit 0 in synchronization with the SCL clock, and each time one-bit data is input, the data of this register are shifted one bit to the left.

The I²C data shift register is in a write enable status only when the ESO bit of the I²C control register (address 00DA₁₆) is "1." The bit counter is reset by a write instruction to the I²C data shift register. When both the ESO bit and the MST bit of the I²C status register (address 00D9₁₆) are "1," the SCL is output by a write instruction to the I²C data shift register. Reading data from the I²C data shift register is always enabled regardless of the ESO bit value.

Note: To write data into the I²C data shift register after setting the MST bit to "0" (slave mode), keep an interval of 8 machine cycles or more.

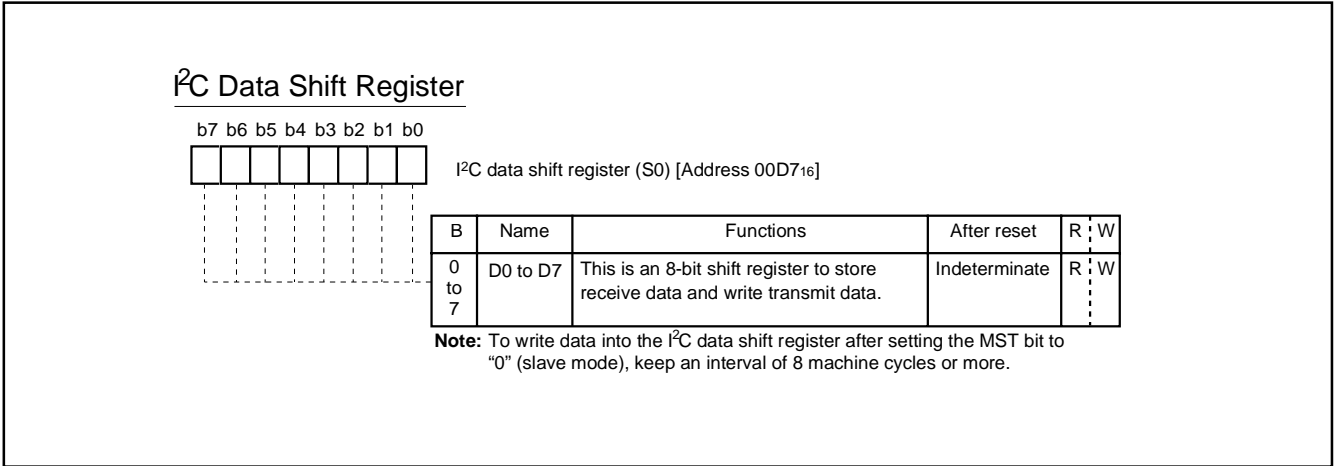

Fig. 8.6.2 Data Shift Register

M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.6.2 I²C Address Register

The I²C address register (address 00D816) consists of a 7-bit slave address and a read/write bit. In the addressing mode, the slave address written in this register is compared with the address data to be received immediately after the START condition are detected.

(1) Bit 0: read/write bit (RBW)

Not used when comparing addresses, in the 7-bit addressing mode.
In the 10-bit addressing mode, the first address data to be received is compared with the contents (SAD6 to SAD0 + RBW) of the I²C address register.
The RBW bit is cleared to "0" automatically when the stop condition is detected.

(2) Bits 1 to 7: slave address (SAD0–SAD6)

These bits store slave addresses. Regardless of the 7-bit addressing mode and the 10-bit addressing mode, the address data transmitted from the master is compared with the contents of these bits.

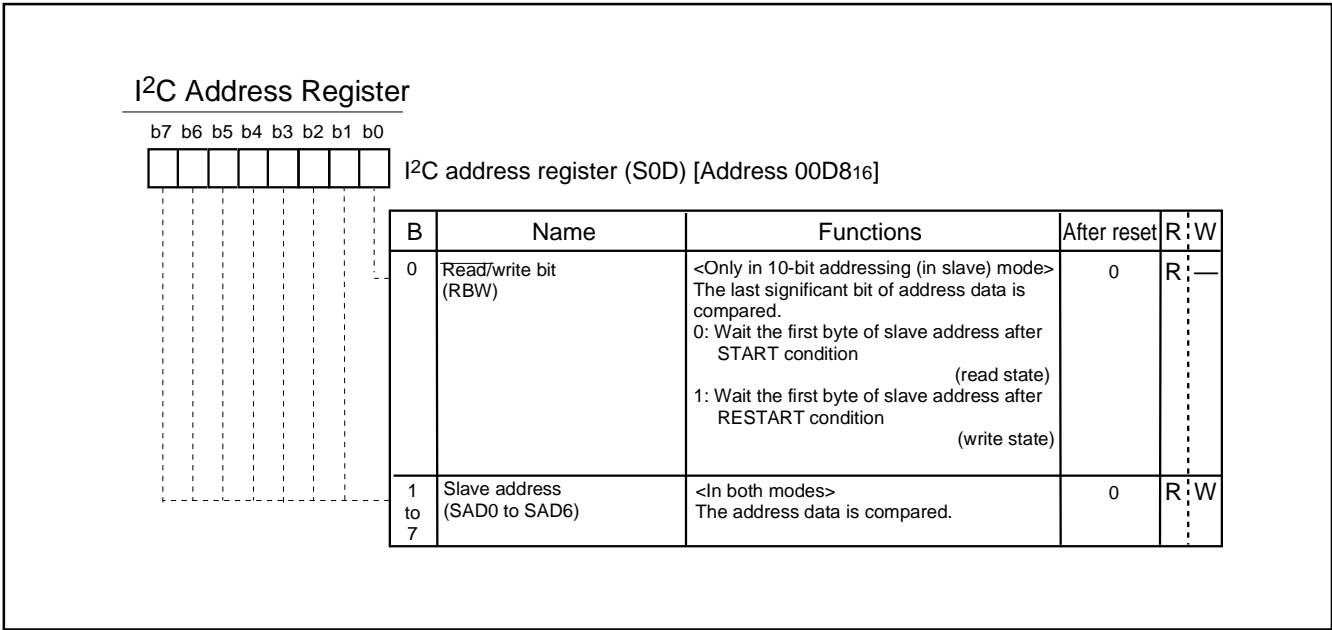

Fig. 8.6.3 I²C Address Register

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.6.3 I²C Clock Control Register

The I²C clock control register (address 00DB₁₆) is used to set ACK control, SCL mode and SCL frequency.

(1) Bits 0 to 4: SCL frequency control bits (CCR0-CCR4)

These bits control the SCL frequency.

(2) Bit 5: SCL mode specification bit (FAST MODE)

This bit specifies the SCL mode. When this bit is set to "0," the standard clock mode is set. When the bit is set to "1," the high-speed clock mode is set.

(3) Bit 6: ACK bit (ACK BIT)

This bit sets the SDA status when an ACK clock* is generated. When this bit is set to "0," the ACK return mode is set and SDA goes to LOW at the occurrence of an ACK clock. When the bit is set to "1," the ACK non-return mode is set. The SDA is held in the HIGH status at the occurrence of an ACK clock.

However, when the slave address matches the address data in the reception of address data at ACK BIT = "0," the SDA is automatically made LOW (ACK is returned). If there is a mismatch between the slave address and the address data, the SDA is automatically made HIGH (ACK is not returned).

(4) Bit 7: ACK clock bit (ACK)

This bit specifies a mode of acknowledgment which is an acknowledgment response of data transmission. When this bit is set to "0," the no ACK clock mode is set. In this case, no ACK clock occurs after data transmission. When the bit is set to "1," the ACK clock mode is set and the master generates an ACK clock upon completion of each 1-byte data transmission. The device for transmitting address data and control data releases the SDA at the occurrence of an ACK clock (make SDA HIGH) and receives the ACK bit generated by the data receiving device.

Note: Do not write data into the I²C clock control register during transmission. If data is written during transmission, the I²C clock generator is reset, so that data cannot be transmitted normally.

*ACK clock: Clock for acknowledgement

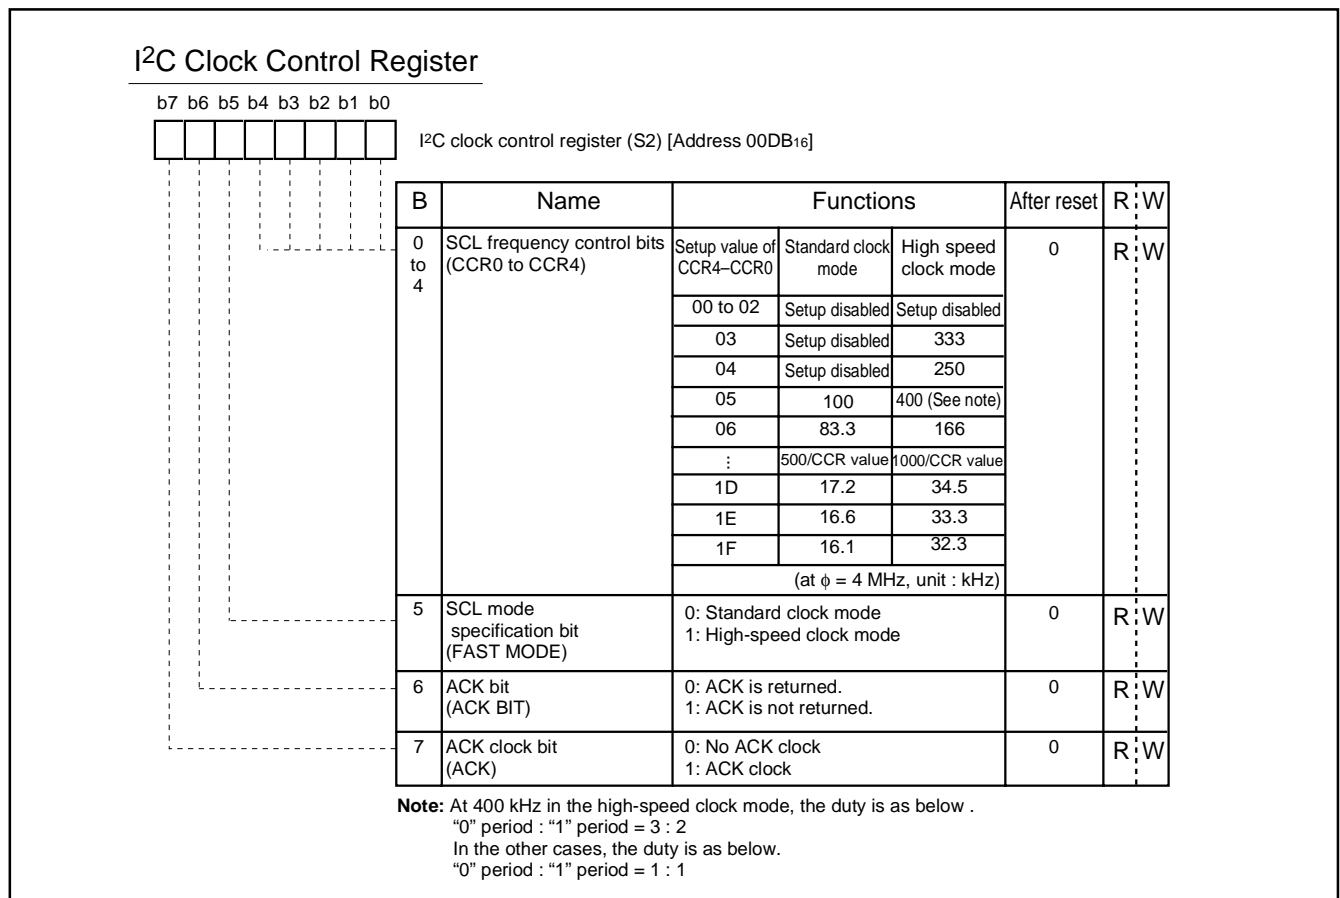

Fig. 8.6.4 I²C Address Register

8.6.4 I²C Control Register

The I²C control register (address 00DA16) controls the data communication format.

(1) Bits 0 to 2: bit counter (BC0-BC2)

These bits decide the number of bits for the next 1-byte data to be transmitted. An interrupt request signal occurs immediately after the number of bits specified with these bits are transmitted.

When a START condition is received, these bits become "0002" and the address data is always transmitted and received in 8 bits.

(2) Bit 3: I²C interface use enable bit (ESO)

This bit enables usage of the multimaster I²C BUS interface. When this bit is set to "0," the use disable status is provided, so the SDA and the SCL become high-impedance. When the bit is set to "1," use of the interface is enabled.

When ESO = "0," the following is performed.

- PIN = "1," BB = "0" and AL = "0" are set (they are bits of the I²C status register at address 00D916).
- Writing data to the I²C data shift register (address 00D716) is disabled.

(3) Bit 4: data format selection bit (ALS)

This bit decides whether or not to recognize slave addresses. When this bit is set to "0," the addressing format is selected, so that address data is recognized. When a match is found between a slave address and address data as a result of comparison or when a general call (refer to "8.6.5 I²C Status Register," bit 1) is received, transmission processing can be performed. When this bit is set to "1," the free data format is selected, so that slave addresses are not recognized.

(4) Bit 5: addressing format selection bit (10BIT SAD)

This bit selects a slave address specification format. When this bit is set to "0," the 7-bit addressing format is selected. In this case, only the high-order 7 bits (slave address) of the I²C address register (address 00D816) are compared with address data. When this bit is set to "1," the 10-bit addressing format is selected, all the bits of the I²C address register are compared with address data.

(5) Bits 6 and 7: connection control bits between I²C-BUS interface and ports (BSEL0, BSEL1)

These bits controls the connection between SCL and ports or SDA and ports (refer to Figure 8.6.5).

Fig. 8.6.5 Connection Port Control by BSEL0 and BSEL1

8.6.5 I²C Status Register

The I²C status register (address 00D9₁₆) controls the I²C-BUS interface status. The low-order 4 bits are read-only bits and the high-order 4 bits can be read out and written to.

(1) Bit 0: last receive bit (LRB)

This bit stores the last bit value of received data and can also be used for ACK receive confirmation. If ACK is returned when an ACK clock occurs, the LRB bit is set to "0." If ACK is not returned, this bit is set to "1." Except in the ACK mode, the last bit value of received data is input. The state of this bit is changed from "1" to "0" by executing a write instruction to the I²C data shift register (address 00D7₁₆).

(2) Bit 1: general call detecting flag (AD0)

This bit is set to "1" when a general call* whose address data is all "0" is received in the slave mode. By a general call of the master device, every slave device receives control data after the general call. The AD0 bit is set to "0" by detecting the STOP condition or START condition.

*General call: The master transmits the general call address "00₁₆" to all slaves.

(3) Bit 2: slave address comparison flag (AAS)

This flag indicates a comparison result of address data.

- In the slave receive mode, when the 7-bit addressing format is selected, this bit is set to "1" in one of the following conditions.
 - The address data immediately after occurrence of a START condition matches the slave address stored in the high-order 7 bits of the I²C address register (address 00D8₁₆).
 - A general call is received.
- In the slave reception mode, when the 10-bit addressing format is selected, this bit is set to "1" with the following condition.
 - When the address data is compared with the I²C address register (8 bits consists of slave address and RBW), the first bytes match.
- The state of this bit is changed from "1" to "0" by executing a write instruction to the I²C data shift register (address 00D7₁₆).

(4) Bit 3: arbitration lost* detecting flag (AL)

In the master transmission mode, when a device other than the microcomputer sets the SDA to "L", arbitration is judged to have been lost, so that this bit is set to "1." At the same time, the TRX bit is set to "0," so that immediately after transmission of the byte whose arbitration was lost is completed, the MST bit is set to "0." When arbitration is lost during slave address transmission, the TRX bit is set to "0" and the reception mode is set. Consequently, it becomes possible to receive and recognize its own slave address transmitted by another master device.

*Arbitration lost: The status in which communication as a master is disabled.

(5) Bit 4: I²C-BUS interface interrupt request bit (PIN)

This bit generates an interrupt request signal. Each time 1-byte data is transmitted, the state of the PIN bit changes from "1" to "0." At the same time, an interrupt request signal is sent to the CPU. The PIN bit is set to "0" in synchronization with a falling edge of the last clock (including the ACK clock) of an internal clock and an interrupt request signal occurs in synchronization with a falling edge of the PIN bit. When the PIN bit is "0," the SCL is kept in the "0" state and clock generation is disabled. Figure 8.6.8 shows an interrupt request signal generating timing chart.

The PIN bit is set to "1" in any one of the following conditions.

- Executing a write instruction to the I²C data shift register (address 00D7₁₆).
- When the ESO bit is "0"
- At reset

The conditions in which the PIN bit is set to "0" are shown below:

- Immediately after completion of 1-byte data transmission (including when arbitration lost is detected)
- Immediately after completion of 1-byte data reception
- In the slave reception mode, with ALS = "0" and immediately after completion of slave address or general call address reception
- In the slave reception mode, with ALS = "1" and immediately after completion of address data reception

(6) Bit 5: bus busy flag (BB)

This bit indicates the status of use of the bus system. When this bit is set to "0," this bus system is not busy and a START condition can be generated. When this bit is set to "1," this bus system is busy and the occurrence of a START condition is disabled by the START condition duplication prevention function (See note).

This flag can be written by software only in the master transmission mode. In the other modes, this bit is set to "1" by detecting a START condition and set to "0" by detecting a STOP condition. When the ESO bit of the I²C control register (address 00DA₁₆) is "0" and at reset, the BB flag is kept in the "0" state.

(7) Bit 6: communication mode specification bit (transfer direction specification bit: TRX)

This bit decides the direction of transfer for data communication. When this bit is "0," the reception mode is selected and the data of a transmitting device is received. When the bit is "1," the transmission mode is selected and address data and control data are output into the SDA in synchronization with the clock generated on the SCL.

When the ALS bit of the I²C control register (address 00DA₁₆) is "0" in the slave reception mode is selected, the TRX bit is set to "1" (transmit) if the least significant bit (R/W bit) of the address data transmitted by the master is "1." When the ALS bit is "0" and the R/W bit is "0," the TRX bit is cleared to "0" (receive).

The TRX bit is cleared to "0" in one of the following conditions.

- When arbitration lost is detected.
- When a STOP condition is detected.
- When occurrence of a START condition is disabled by the START condition duplication prevention function (Note).
- With MST = "0" and when a START condition is detected.
- With MST = "0" and when ACK non-return is detected.
- At reset

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

(8) Bit 7: Communication mode specification bit (master/slave specification bit: MST)

This bit is used for master/slave specification for data communication. When this bit is "0," the slave is specified, so that a START condition and a STOP condition generated by the master are received, and data communication is performed in synchronization with the clock generated by the master. When this bit is "1," the master is specified and a START condition and a STOP condition are generated, and also the clocks required for data communication are generated on the SCL.

The MST bit is cleared to "0" in one of the following conditions.

- Immediately after completion of 1-byte data transmission when arbitration lost is detected
- When a STOP condition is detected.
- When occurrence of a START condition is disabled by the START condition duplication preventing function (Note).
- At reset

Note: The START condition duplication prevention function disables the START condition generation, reset of bit counter reset, and SCL output, when the following condition is satisfied:
a START condition is set by another master device.

8.6.6 START Condition Generation Method

When the ESO bit of the I²C control register (address 00DA₁₆) is "1," execute a write instruction to the I²C status register (address 00D9₁₆) to set the MST, TRX and BB bits to "1." A START condition will then be generated. After that, the bit counter becomes "000₂" and an SCL for 1 byte is output. The START condition generation timing and BB bit set timing are different in the standard clock mode and the high-speed clock mode. Refer to Figure 8.6.9 for the START condition generation timing diagram, and Table 8.6.2 for the START condition/STOP condition generation timing table.

Fig. 8.6.9 START Condition Generation Timing Diagram

8.6.7 STOP Condition Generation Method

When the ESO bit of the I²C control register (address 00DA₁₆) is "1," execute a write instruction to the I²C status register (address 00D9₁₆) for setting the MST bit and the TRX bit to "1" and the BB bit to "0". A STOP condition will then be generated. The STOP condition generation timing and the BB flag reset timing are different in the standard clock mode and the high-speed clock mode. Refer to Figure 8.6.10 for the STOP condition generation timing diagram, and Table 8.6.2 for the START condition/STOP condition generation timing table.

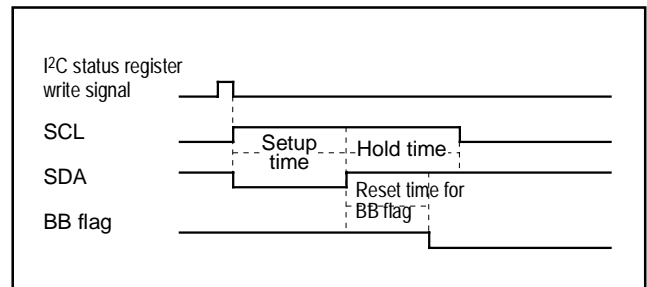

Fig. 8.6.10 STOP Condition Generation Timing Diagram

Table 8.6.2 START Condition/STOP Condition Generation Timing Table

Item	Standard Clock Mode	High-speed Clock Mode
Setup time (START condition)	5.0 μ s (20 cycles)	2.5 μ s (10 cycles)
Setup time (STOP condition)	4.25 μ s (17 cycles)	1.75 μ s (7 cycles)
Hold time	5.0 μ s (20 cycles)	2.5 μ s (10 cycles)
Set/reset time for BB flag	3.0 μ s (12 cycles)	1.5 μ s (6 cycles)

Note: Absolute time at $\phi = 4$ MHz. The value in parentheses denotes the number of ϕ cycles.

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.6.8 START/STOP Condition Detect Conditions

The START/STOP condition detect conditions are shown in Figure 8.6.11 and Table 8.6.3. Only when the 3 conditions of Table 8.6.3 are satisfied, a START/STOP condition can be detected.

Note: When a STOP condition is detected in the slave mode (MST = 0), an interrupt request signal "LICIRQ" is generated to the CPU.

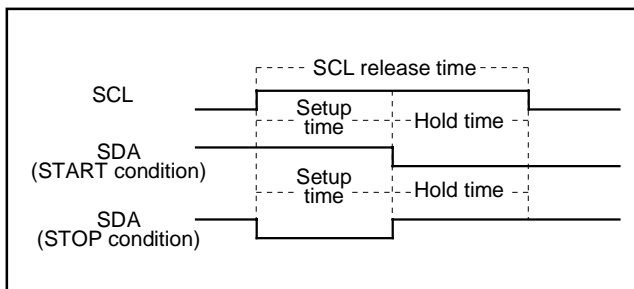

Fig. 8.6.11 START Condition/STOP Condition Detect Timing Diagram

Table 8.6.3 START Condition/STOP Condition Detect Conditions

Standard Clock Mode	High-speed Clock Mode
6.5 μ s (26 cycles) < SCL release time	1.0 μ s (4 cycles) < SCL release time
3.25 μ s (13 cycles) < Setup time	0.5 μ s (2 cycles) < Setup time
3.25 μ s (13 cycles) < Hold time	0.5 μ s (2 cycles) < Hold time

Note: Absolute time at $\phi = 4$ MHz. The value in parentheses denotes the number of ϕ cycles.

8.6.9 Address Data Communication

There are two address data communication formats, namely, 7-bit addressing format and 10-bit addressing format. The respective address communication formats is described below.

(1) 7-bit addressing format

To meet the 7-bit addressing format, set the 10BIT SAD bit of the I²C control register (address 00DA₁₆) to "0." The first 7-bit address data transmitted from the master is compared with the high-order 7-bit slave address stored in the I²C address register (address 00D8₁₆). At the time of this comparison, address comparison of the RBW bit of the I²C address register (address 00D8₁₆) is not made. For the data transmission format when the 7-bit addressing format is selected, refer to Figure 8.6.12, (1) and (2).

(2) 10-bit addressing format

To meet the 10-bit addressing format, set the 10BIT SAD bit of the I²C control register (address 00DA₁₆) to "1." An address comparison is made between the first-byte address data transmitted from the master and the 7-bit slave address stored in the I²C address register (address 00D8₁₆). At the time of this comparison, an address comparison between the RBW bit of the I²C address register (address 00D8₁₆) and the R/W bit which is the last bit of the address data transmitted from the master is made. In the 10-bit addressing mode, the R/W bit which is the last bit of the address data not only specifies the direction of communication for control data but also is processed as an address data bit.

When the first-byte address data matches the slave address, the AAS bit of the I²C status register (address 00D9₁₆) is set to "1." After the second-byte address data is stored into the I²C data shift register (address 00D7₁₆), make an address comparison between the second-byte data and the slave address by software. When the address data of the 2nd bytes matches the slave address, set the RBW bit of the I²C address register (address 00D8₁₆) to "1" by software. This processing can match the 7-bit slave address and R/W data, which are received after a RESTART condition is detected, with the value of the I²C address register (address 00D8₁₆). For the data transmission format when the 10-bit addressing format is selected, refer to Figure 8.6.12, (3) and (4).

8.6.10 Example of Master Transmission

An example of master transmission in the standard clock mode, at the SCL frequency of 100 kHz and in the ACK return mode is shown below.

- ① Set a slave address in the high-order 7 bits of the I²C address register (address 00D8₁₆) and "0" in the RBW bit.
- ② Set the ACK return mode and SCL = 100 kHz by setting "85₁₆" in the I²C clock control register (address 00DB₁₆).
- ③ Set "10₁₆" in the I²C status register (address 00D9₁₆) and hold the SCL at the HIGH.
- ④ Set a communication enable status by setting "48₁₆" in the I²C control register (address 00DA₁₆).
- ⑤ Set the address data of the destination of transmission in the high-order 7 bits of the I²C data shift register (address 00D7₁₆) and set "0" in the least significant bit.
- ⑥ Set "F0₁₆" in the I²C status register (address 00D9₁₆) to generate a START condition. At this time, an SCL for 1 byte and an ACK clock automatically occurs.
- ⑦ Set transmit data in the I²C data shift register (address 00D7₁₆). At this time, an SCL and an ACK clock automatically occurs.
- ⑧ When transmitting control data of more than 1 byte, repeat step ⑦.
- ⑨ Set "D0₁₆" in the I²C status register (address 00D9₁₆). After this, if ACK is not returned or transmission ends, a STOP condition will be generated.

8.6.11 Example of Slave Reception

An example of slave reception in the high-speed clock mode, at the SCL frequency of 400 kHz, in the ACK non-return mode, using the addressing format, is shown below.

- ① Set a slave address in the high-order 7 bits of the I²C address register (address 00D8₁₆) and "0" in the RBW bit.
- ② Set the no ACK clock mode and SCL = 400 kHz by setting "25₁₆" in the I²C clock control register (address 00DB₁₆).
- ③ Set "10₁₆" in the I²C status register (address 00D9₁₆) and hold the SCL at the HIGH.
- ④ Set a communication enable status by setting "48₁₆" in the I²C control register (address 00DA₁₆).
- ⑤ When a START condition is received, an address comparison is made.
- ⑥ •When all transmitted address are "0" (general call):
AD0 of the I²C status register (address 00D9₁₆) is set to "1" and an interrupt request signal occurs.
•When the transmitted addresses match the address set in ①:
ASS of the I²C status register (address 00D9₁₆) is set to "1" and an interrupt request signal occurs.
•In the cases other than the above:
AD0 and AAS of the I²C status register (address 00D9₁₆) are set to "0" and no interrupt request signal occurs.
- ⑦ Set dummy data in the I²C data shift register (address 00D7₁₆).
- ⑧ When receiving control data of more than 1 byte, repeat step ⑦.
- ⑨ When a STOP condition is detected, the communication ends.

8.6.12 Precautions when using multi-master I²C-BUS interface

(1) Read-modify-write instruction

The precautions when the read-modify-write instruction such as SEB, CLB etc. is executed for each register of the multi-master I²C-BUS interface are described below.

•I²C data shift register (S0)

When executing the read-modify-write instruction for this register during transfer, data may become a value not intended.

•I²C address register (S0D)

When the read-modify-write instruction is executed for this register at detecting the STOP condition, data may become a value not intended. It is because hardware changes the read/write bit (RBW) at the above timing.

•I²C status register (S1)

Do not execute the read-modify-write instruction for this register because all bits of this register are changed by hardware.

•I²C control register (S1D)

When the read-modify-write instruction is executed for this register at detecting the START condition or at completing the byte transfer, data may become a value not intended. Because hardware changes the bit counter (BC0-BC2) at the above timing.

•I²C clock control register (S2)

The read-modify-write instruction can be executed for this register.

(2) START condition generating procedure using multi-master

①Procedure example (The necessary conditions of the generating procedure are described as the following ② to ⑤).

```

•
•
LDA    —          (Taking out of slave address value)
SEI    —          (Interrupt disabled)
BBS    5,S1,BUSBUSY (BB flag confirming and branch process)
BUSFREE:
STA    S0          (Writing of slave address value)
LDM    #$F0, S1    (Trigger of START condition generating)
CLI    —          (Interrupt enabled)
•
•
BUSBUSY:
CLI    —          (Interrupt enabled)
•
•

```

②Use "STA," "STX" or "STY" of the zero page addressing instruction for writing the slave address value to the I²C data shift register.

③Use "LDM" instruction for setting trigger of START condition generating.

④Write the slave address value of above ② and set trigger of START condition generating of above ③ continuously shown the above procedure example.

⑤Disable interrupts during the following three process steps:

- BB flag confirming
- Writing of slave address value
- Trigger of START condition generating

When the condition of the BB flag is bus busy, enable interrupts immediately.

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

(3) RESTART condition generating procedure

①Procedure example (The necessary conditions of the generating procedure are described as the following ② to ⑥.)

Execute the following procedure when the PIN bit is "0."

```

•
•
LDM  #$00, S1    (Select slave receive mode)
LDA   —          (Taking out of slave address value)
SEI   —          (Interrupt disabled)
STA   S0          (Writing of slave address value)
LDM   #$F0, S1    (Trigger of RESTART condition generating)
CLI   —          (Interrupt enabled)
•
•

```

②Select the slave receive mode when the PIN bit is "0." Do not write "1" to the PIN bit. Neither "0" nor "1" is specified for the writing to the BB bit.

The TRX bit becomes "0" and the SDA pin is released.

③The SCL pin is released by writing the slave address value to the I²C data shift register. Use "STA," "STX" or "STY" of the zero page addressing instruction for writing.

④Use "LDM" instruction for setting trigger of RESTART condition generating.

⑤Write the slave address value of above ③ and set trigger of RESTART condition generating of above ④ continuously shown the above procedure example.

⑥Disable interrupts during the following two process steps:

- Writing of slave address value
- Trigger of RESTART condition generating

(4) STOP condition generating procedure

①Procedure example (The necessary conditions of the generating procedure are described as the following ② to ④.)

```

•
•
SEI   —          (Interrupt disabled)
LDM   #$C0, S1    (Select master transmit mode)
NOP   —          (Set NOP)
LDM   #$D0, S1    (Trigger of STOP condition generating)
CLI   —          (Interrupt enabled)
•
•

```

②Write "0" to the PIN bit when master transmit mode is select.

③Execute "NOP" instruction after setting of master transmit mode. Also, set trigger of STOP condition generating within 10 cycles after selecting of master transmit mode.

④Disable interrupts during the following two process steps:

- Select of master transmit mode
- Trigger of STOP condition generating

(5) Writing to I²C status register

Do not execute an instruction to set the PIN bit to "1" from "0" and an instruction to set the MST and TRX bits to "0" from "1" simultaneously. It is because it may enter the state that the SCL pin is released and the SDA pin is released after about one machine cycle. Do not execute an instruction to set the MST and TRX bits to "0" from "1" simultaneously when the PIN bit is "1." It is because it may become the same as above.

(6) Process of after STOP condition generating

Do not write data in the I²C data shift register S0 and the I²C status register S1 until the bus busy flag BB becomes "0" after generating the STOP condition in the master mode. It is because the STOP condition waveform might not be normally generated. Reading to the above registers do not have the problem.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.7 PWM OUTPUT FUNCTION

This microcomputer is equipped with two 14-bit PWM (DA) and eight 8-bit PWMs (PWM0–PWM7). DA1 and DA2 have a 14-bit resolution with the minimum resolution bit width of $0.25\ \mu\text{s}$ and a repeat period of $4096\ \mu\text{s}$ (for $f(X_{IN}) = 8\ \text{MHz}$). PWM0–PWM7 have the same circuit structure and an 8-bit resolution with minimum resolution bit width of $4\ \mu\text{s}$ and repeat period of $1024\ \mu\text{s}$ (for $f(X_{IN}) = 8\ \text{MHz}$).

Figure 8.7.1 shows the PWM block diagram. The PWM timing generating circuit applies individual control signals to DA and PWM0–PWM7 using $f(X_{IN})$ divided by 2 as a reference signal.

8.7.1 Data Setting

When outputting DA, first set the high-order 8 bits to the DA-H register (address 00CE₁₆), then the low-order 6 bits to the DA-L register (address 00CF₁₆). When outputting PWM0–PWM7, set 8-bit output data to the PWM_i register (i means 0 to 7; addresses 00D0₁₆ to 00D4₁₆, 00F6₁₆ to 00F8₁₆).

8.7.2 Transferring Data from Registers to PWM Circuit

Data transfer from the 8-bit PWM register to the 8-bit PWM circuit is executed at writing data to the register.

The signal output from the 8-bit PWM output pin corresponds to the contents of this register.

Also, data transfer from the DA register (addresses 00CE₁₆ and 00CF₁₆) to the 14-bit PWM circuit is executed at writing data to the DA-L register (address 00CF₁₆). Reading from the DA-H register (address 00CE₁₆) means reading this transferred data. Accordingly, it is possible to confirm the data being output from the DA output pin by reading the DA register.

8.7.3 Operating of 8-bit PWM

The following explains PWM operation.

First, set the bit 0 of PWM output control register 1 (address 00D5₁₆) to "0" (at reset, bit 0 is already set to "0" automatically), so that the PWM count source is supplied.

PWM0–PWM3 are also used as pins P60–P63, PWM4–PWM7 are also used as ports P00–P03, respectively. For PWM0–PWM3, set the corresponding bits of the ports P6 direction register to "1" (output mode). For PWM4–PWM7, set those of the port P0 direction register to "1." And select each output polarity by bit 3 of PWM output control register 2 (address 00D6₁₆). Then, for PWM0–PWM5, set bits 2 to 7 of PWM output control register 1 to "1" (PWM output). For PWM6 and PWM7, set bits 0 and 1 of PWM output control register 2 to "1."

The PWM waveform is output from the PWM output pins by setting these registers.

Figure 8.7.2 shows the 8-bit PWM timing. One cycle (T) is composed of 256 (2^8) segments. The 8 kinds of pulses, relative to the weight of each bit (bits 0 to 7), are output inside the circuit during 1 cycle. Refer to Figure 8.7.2 (a). The 8-bit PWM outputs waveform which is the logical sum (OR) of pulses corresponding to the contents of bits 0 to 7 of the 8-bit PWM register. Several examples are shown in Figure 8.7.2 (b). 256 kinds of output (HIGH area: 0/256 to 255/256) are selected by changing the contents of the PWM register. A length of entirely HIGH output cannot be output, i.e. 256/256.

8.7.4 Operating of 14-bit PWM

As with 8-bit PWM, set the bit 0 of PWM output control register 1 (address 00D5₁₆) to "0" (at reset, bit 0 is already set to "0" automatically), so that the PWM count source is supplied. Next, select the output polarity by bit 2 of PWM output control register 2 (address 00D6₁₆). Then, the 14-bit PWM outputs from the DA output pin by setting bit 1 of PWM output control register 1 to "0" (at reset, this bit already set to "0" automatically) to select the DA output.

The output example of the 14-bit PWM is shown in Figure 8.7.3.

The 14-bit PWM divides the data of the DA latch into the low-order 6 bits and the high-order 8 bits.

The fundamental waveform is determined with the high-order 8-bit data "DH." A HIGH area with a length $t \times D_H$ (HIGH area of fundamental waveform) is output every short area of " t " = 256τ = $64\ \mu\text{s}$ (τ is the minimum resolution bit width of 250 ns). The HIGH level area increase interval (t_m) is determined with the low-order 6-bit data "DL." The HIGH are of smaller intervals " t_m " shown in Table 5 is longer by t than that of other smaller intervals in PWM repeat period " T " = $64t$. Thus, a rectangular waveform with the different HIGH width is output from the DA pins. Accordingly, the PWM output changes by τ unit pulse width by changing the contents of the DA-H and DA-L registers. A length of entirely HIGH cannot be output, i. e. 256/256.

8.7.5 Output after Reset

At reset, the output of ports P60–P63 and P00–P03 are in the high-impedance state, and the contents of the PWM register and the PWM circuit are undefined. Note that after reset, the PWM output is undefined until setting the PWM register.

Table 8.7.1 Relation Between the Low-order 6-bit Data and High-level Area Increase Interval

Low-order 6 bits of Data	Area Longer by τ than That of Other t_m ($m = 0$ to 63)
0 0 0 0 0 0 ^{LSB}	Nothing
0 0 0 0 0 1	$m = 32$
0 0 0 0 1 0	$m = 16, 48$
0 0 0 1 0 0	$m = 8, 24, 40, 56$
0 0 1 0 0 0	$m = 4, 12, 20, 28, 36, 44, 52, 60$
0 1 0 0 0 0	$m = 2, 6, 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62$
1 0 0 0 0 0	$m = 1, 3, 5, 7, \dots, 57, 59, 61, 63$

8.8 A-D COMPARATOR

A-D comparator consists of 6-bit D-A converter and comparator. A-D comparator block diagram is shown in Figure 8.8.1.

The reference voltage "V_{ref}" for D-A conversion is set by bits 0 to 5 of the A-D control register (address 00EF₁₆).

The comparison result of the analog input voltage and the reference voltage "V_{ref}" is stored in bit 4 of the A-D mode register (address 00EE₁₆).

For A-D comparison, set "0" to corresponding bits of the direction register to use ports as analog input pins. Write the data for select of analog input pins to bits 0 to 2 of the A-D control register 1 and write the digital value corresponding to V_{ref} to be compared to the bits 0 to 5 of the A-D control register. The voltage comparison starts by writing to the A-D control register 2, and it is completed after 16 machine cycles (NOP instruction X 8).

8.9 ROM CORRECTION FUNCTION

This can correct program data in ROM. Up to 2 addresses can be corrected, a program for correction is stored in the ROM correction memory in RAM as the top address. The ROM correction vectors are 2 vectors.

Vector 1 : address 02C0₁₆

Vector 2 : address 02E0₁₆

Set the address of the ROM data to be corrected into the ROM correction address register. When the value of the counter matches the ROM data address in the ROM correction vector as the top address, the main program branches to the correction program stored in the ROM memory for correction. To return from the correction program to the main program, the op code and operand of the JMP instruction (total of 3 bytes) are necessary at the end of the correction program. The ROM correction function is controlled by the ROM correction enable register.

- Notes**
- 1: Specify the first address (op code address) of each instruction as the ROM correction address.
 - 2: Use the JMP instruction (total of 3 bytes) to return from the correction program to the main program.
 - 3: Do not set the same ROM correction address to vectors 1 and 2.
 - 4: Only M37212M8-XXXSP and M37212EFSP/FP have ROM correction function.

8.10 OSD FUNCTIONS

Table 8.10.1 outlines the OSD functions. This microcomputer incorporates an OSD control circuit of 24 characters X 2 lines. OSD is controlled by the CRT control register. Up to 256 kinds of characters can be displayed. The colors can be specified for each character and up to 4 kinds of colors can be displayed on one screen. A combination of up to 8 colors can be obtained by using each output signal (R, G, and B).

Characters are displayed in a 12 X 16 dots configuration to obtain smooth character patterns (refer to Figure 8.10.1).

The following shows the procedure how to display characters on the CRT screen.

- ① Write the display character code in OSD RAM.
- ② Specify the display color by using the color register.
- ③ Write the color register in which the display color is set in OSD RAM.
- ④ Specify the vertical position by using the vertical position register.
- ⑤ Specify the character size by using the character size register.
- ⑥ Specify the horizontal position by using the horizontal position register.
- ⑦ Write the display enable bit to the designated block display flag of the CRT control register. When this is done, the OSD starts according to the input of the VSYNC signal.

Table 8.10.1 Features of Each Display Mode

Parameter	Functions
Number of display characters	24 characters X 2 lines
Dot structure	12 X 16 dots
Kinds of characters	256 kinds
Kinds of character sizes	3 kinds
Attribute	Border (black)
Character font coloring	1 screen : 8 kinds (per character unit)
Character background coloring	1 screen : 8 kinds (per character unit)
OSD output	R, G, B
Display position	Horizontal: 64 levels, Vertical: 128 levels
Display expansion (multiline display)	Possible

8.10.1 Display Position

The display positions of characters are specified in units called a "block." There are 2 blocks, blocks 1 and 2. Up to 24 characters can be displayed in each block (refer to "8.10.3 Memory for OSD").

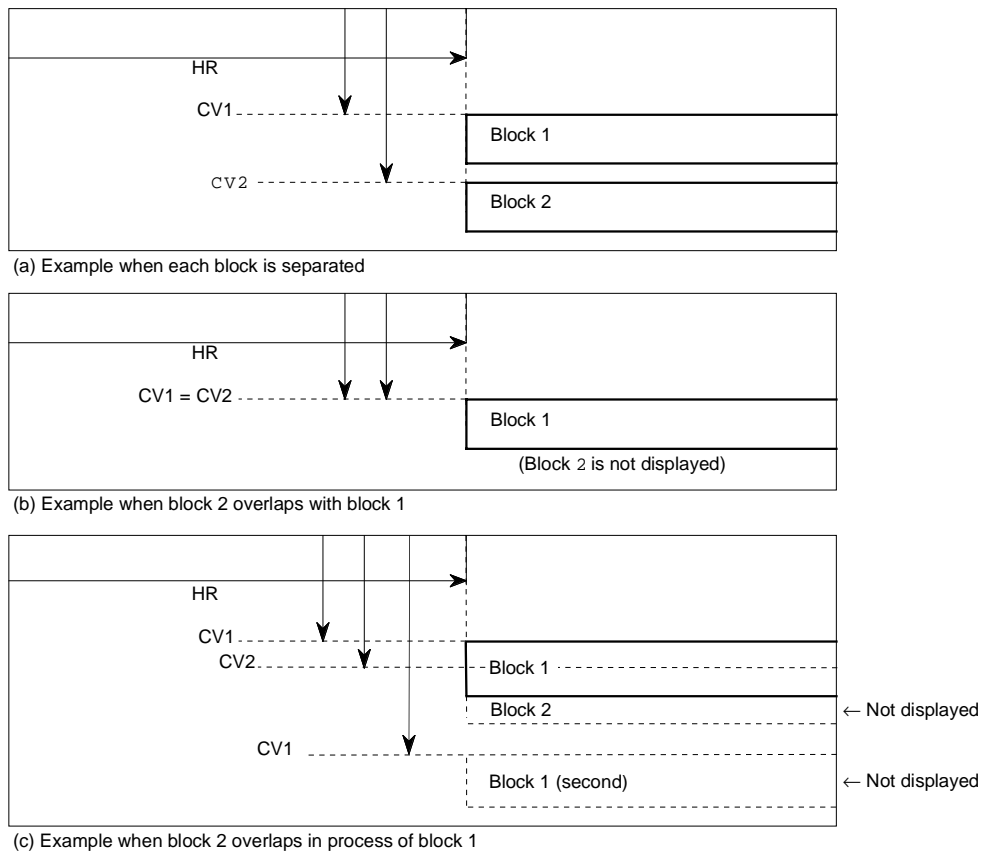

The display position of each block can be set in both horizontal and vertical directions by software.

The display start position in the horizontal direction can be selected for all blocks in common from 64-step display positions in units of 4Tc (Tc = OSD oscillation cycle).

The display start position in the vertical direction for each block can be selected from 128-step display positions in units of 4 scanning lines.

Blocks are displayed in conformance with the following rules:

- Block 2 is displayed after the display of block 1 is completed (Figure 8.10.4 (a)).
- When the display position of block 1 is overlapped with that of block 2 (Figure 8.10.4 (b)), the block 1 is displayed on the front.
- When another block display position appears while one block is displayed (Figure 8.10.4 (c)), only block 1 is displayed. Similarly, when multiline display, block 1 is displayed after the display of block 2 is completed.

Notes 1: CV1 or CV2 indicates the vertical display start position of display block 1 or 2.
2: HR indicates the horizontal display start position of display block 1 or 2.

Fig. 8.10.4 Display Position

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

The vertical display start position is determined by counting the horizontal sync signal (HSYNC). At this time, when VSYNC and HSYNC are positive polarity (negative polarity), it starts to count the rising edge (falling edge) of HSYNC signal from after fixed cycle of rising edge (falling edge) of VSYNC signal. So interval from rising edge (falling edge) of VSYNC signal to rising edge (falling edge) of HSYNC signal needs enough time (2 machine cycles or more) for avoiding jitter. The polarity of HSYNC and VSYNC signals can select with the CRT port control register (address 00EC16).

When bits 0 and 1 of the CRT port control register (address 00EC16) are set to "1" (negative polarity)

- Notes 1 :** The vertical position is determined by counting falling edge of HSYNC signal after rising edge of VSYNC control signal in the microcomputer.
- 2 :** Do not generate falling edge of HSYNC signal near rising edge of VSYNC control signal in microcomputer to avoid jitter.
- 3 :** The pulse width of VSYNC and HSYNC needs 8 machine cycles or more.

Fig. 8.10.5 Supplement Explanation for Display Position

M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

The vertical display start position for each block can be set in 512 steps (where each step is 1TH (TH: HSYNC cycle)) as values "00₁₆" to "7F₁₆" in vertical position register i (i = 1 and 2) (addresses 00E1₁₆ and 00E2₁₆) The vertical position register i is shown in Figure 8.10.6.

M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

The horizontal display start position is common to all blocks, and can be set in 64 steps (where 1 step is 4Tc, Tc being the OSD oscillation cycle) as values “00₁₆” to “3F₁₆” in bits 0 to 5 of the horizontal position register (address 00D1₁₆). The horizontal position register is shown in Figure 8.10.7.

Fig. 8.10.7 Horizontal Position Register

with ON-SCREEN DISPLAY CONTROLLER

8.10.2 Character Size

The size of characters to be displayed can be from 3 sizes for each block. Use the character size register (address 00E4₁₆) to set a character size. The character size of block 1 can be specified by using bits 0 and 1 of the character size register; the character size of block 2 can be specified by using bits 2 and 3. Figure 8.10.8 shows the character size register.

The character size can be selected from 3 sizes: minimum size, medium size and large size. Each character size is determined by the number of scanning lines in the height (vertical) direction and the oscillating cycle for display (Tc) in the width (horizontal) direction. The minimum size consists of [1 scanning line] X [1Tc]; the medium size consists of [2 scanning lines] X [2Tc]; and the large size consists of [3 scanning lines] X [3Tc]. Table 8.10.2 shows the relation between the set values in the character size register and the character sizes.

Fig. 8.10.8 Character Size Register

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

Fig. 8.10.9 Display Start Position of Each Character Size (Horizontal Direction)

Table. 8.10.2 Relation between Set Values in Character Size Register and Character Sizes

Set values of character size register		Character size	Width (horizontal) direction Tc: oscillating cycle for display	Height (vertical) direction scanning lines
CSn1	CSn0			
0	0	Minimum	1 Tc	1
0	1	Medium	2 Tc	2
1	0	Large	3 Tc	3
1	1	This is not available		

Note: The display start position in the horizontal direction is not affected by the character size. In other words, the horizontal display start position is common to all blocks even when the character size varies with each block (refer to Figure 8.10.9).

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.10.3 Clock for OSD

As a clock for display to be used for OSD, it is possible to select one of the following 4 types.

- Main clock supplied from XIN pin
- Main clock supplied from XIN pin divided by 1.5
- Clock from the ceramic resonator or the LC or oscillator from the pins OSC1 and OSC2
- Clock from the ceramic resonator or the quartz-crystal oscillator supplied from the pins OSC1 and OSC2.

This OSD clock for each block can be selected by the CRT clock selection register (address 00ED16).

When selecting the main clock, set the oscillation frequency to 8 MHz.

CRT Clock Selection Register

CRT clock selection register (CK) [Address 00ED16]

B	Name			Functions	After reset	R	W	
0, 1	CRT clock selection bits (CK0,CK1)	b1	b0	Functions		0	R	W
		0	0	The clock for display is supplied by connecting RC or LC across the pins OSC1 and OSC2.				
		0	1	Since the main clock is used as the clock for display, the oscillation frequency is limited. Because of this, the character size in width (horizontal) direction is also limited. In this case, pins OSC1 and OSC2 are also used as input ports P36 and P37 respectively.	OSD oscillation frequency = f(XIN)			
		1	0		OSD oscillation frequency = f(XIN)/1.5			
		1	1	The clock for OSD is supplied by connecting the following across the pins OSC1 and OSC2. <ul style="list-style-type: none">• a ceramic resonator only for OSD and a feedback resistor• a quartz-crystal oscillator only for OSD and a feedback resistor (See note)				
2 to 7	Fix these bits to "0."				0	R	W	

Note: It is necessary to connect other ceramic resonator or quartz-crystal oscillator across the pins XIN and XOUT.

8.10.4 Memory for OSD

There are 2 types of memory for OSD : OSD ROM (addresses 10000₁₆ to 11FFF₁₆) used to store character dot data and OSD RAM (addresses 0600₁₆ to 06B7₁₆) used to specify the characters and colors to be displayed.

(1) OSD ROM (addresses 10000₁₆ to 11FFF₁₆)

The dot pattern data for OSD characters is stored in OSD ROM. To specify the kinds of the character font, it is necessary to write the character code (Table 8.10.3) into the OSD RAM.

The OSD ROM has a capacity of 8K bytes. Since 32 bytes are required for 1 character data, the ROM can stores up to 256 kinds of characters.

The OSD ROM space is broadly divided into 2 areas. The [vertical 16 dots] X [horizontal (left side) 8 dots] data of display characters are stored in addresses 10000₁₆ to 107FF₁₆ and 11000₁₆ to 117FF₁₆ ; the [vertical 16 dots] X [horizontal (right side) 4 dots] data of display characters are stored in addresses 10800₁₆ to 10FFF₁₆ and 11800₁₆ to 11FFF₁₆ (refer to Figure 8.10.11). Note however that the high-order 4 bits in the data to be written to addresses 10800₁₆ to 10FFF₁₆ and 11800₁₆ to 11FFF₁₆ must be set to "1" (by writing data "FX₁₆").

Data of the character font is specified shown in Figure 8.10.11.

Fig. 8.10.11 Character Font Data Storing Address

Table 8.10.3 Character Code List (Partially Abbreviated)

Character code	Character data storage address	
	Left 8 dots lines	Right 4 dots lines
00 ₁₆	10000 ₁₆ to 1000F ₁₆	10800 ₁₆ to 1080F ₁₆
01 ₁₆	10010 ₁₆ to 1001F ₁₆	10810 ₁₆ to 1081F ₁₆
02 ₁₆	10020 ₁₆ to 1002F ₁₆	10820 ₁₆ to 1082F ₁₆
03 ₁₆	10030 ₁₆ to 1003F ₁₆	10830 ₁₆ to 1083F ₁₆
:	:	:
7E ₁₆	107E0 ₁₆ to 107EF ₁₆	10FE0 ₁₆ to 10FEF ₁₆
7F ₁₆	107F0 ₁₆ to 107FF ₁₆	10FF0 ₁₆ to 10FFF ₁₆
80 ₁₆	11000 ₁₆ to 1100F ₁₆	11800 ₁₆ to 1180F ₁₆
81 ₁₆	11010 ₁₆ to 1101F ₁₆	11810 ₁₆ to 1181F ₁₆
:	:	:
FD ₁₆	117D0 ₁₆ to 117DF ₁₆	11FD0 ₁₆ to 11FDF ₁₆
FE ₁₆	117E0 ₁₆ to 117EF ₁₆	11FE0 ₁₆ to 11FEF ₁₆
FF ₁₆	117F0 ₁₆ to 117FF ₁₆	11FF0 ₁₆ to 11FFF ₁₆

(2) OSD RAM (addresses 0600₁₆ to 06B7₁₆)

The OSD RAM is allocated at addresses 0600₁₆ to 06B7₁₆, and is divided into a display character code specification part, and color code specification part for each block. Table 8.10.4 shows the contents of the OSD RAM.

For example, to display 1 character position (the left edge) in block 1, write the character code in address 0600₁₆, write the color code at 0680₁₆.

The structure of the OSD RAM is shown in Figure 8.10.12.

Table 8.10.4 Contents of OSD RAM

Block	Display Position (from left)	Character Code Specification	Color Specification
Block 1	1st character	0600 ₁₆	0680 ₁₆
	2nd character	0601 ₁₆	0681 ₁₆
	3rd character	0602 ₁₆	0682 ₁₆
	:	:	:
	22nd character	0615 ₁₆	0695 ₁₆
	23rd character	0616 ₁₆	0696 ₁₆
	24th character	0617 ₁₆	0697 ₁₆
Not used		0618 ₁₆	0698 ₁₆
		:	:
		061F ₁₆	069F ₁₆
Block 2	1st character	0620 ₁₆	06A0 ₁₆
	2nd character	0621 ₁₆	06A1 ₁₆
	3rd character	0622 ₁₆	06A2 ₁₆
	:	:	:
	22nd character	0635 ₁₆	06B5 ₁₆
	23rd character	0636 ₁₆	06B6 ₁₆
	24th character	0637 ₁₆	06B7 ₁₆

8.10.5 Color Register

The color of a displayed character can be specified by setting the color to one of the 4 registers (CO0 to CO3: addresses 00E6₁₆ to 00E9₁₆) and then specifying that color register with the OSD RAM. There are 3 color outputs; R, G and B. By using a combination of these outputs, it is possible to set 8 colors. However, since only 4 color registers are available, up to 4 colors can be disabled at one time.

R, G and B outputs are set by using bits 1 to 3 in the color register. Bit 5 is used to specify whether a character output or blank output. Bits 4, 6 and 7 are used to specify character background color. Figure 8.10.12 shows the color register.

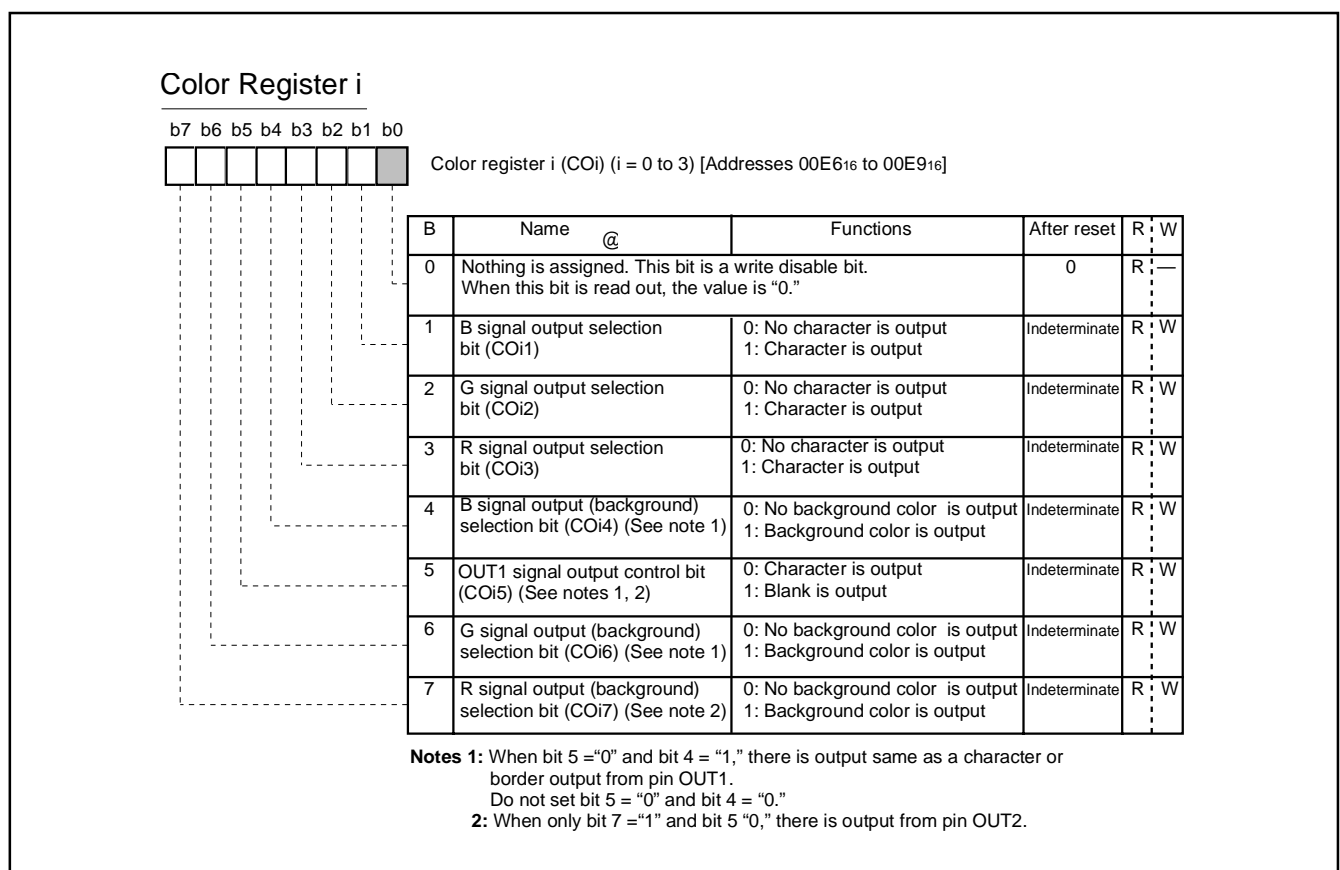

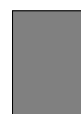

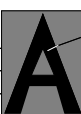

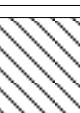

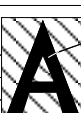

Fig. 8.10.13 Color Register i

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

Table 8.10.5 Display Example of Character Background Coloring (When Green Is Set for a Character and Blue Is Set for Background Color)

Border selection register				Color register i				G output	B output	OUT1 output	Character output	OUT2 output
MD ₀	COi7	COi6	COi5	COi4	COi3	COi2	COi1					
0	0	X	0	1	0	1	0		No output	 Same output as character A	 Green Video signal and character color (green) are not mixed.	No output (See note 2)
0	1	X	0	1	0	1	0		No output	 Same output as character A	 Green Video signal and character color (green) are not mixed.	 Blank output
0	0	0	1	0	0	1	0		No output	 Blank output	 Green TV image of character background is not displayed.	No output (See note 2)
0	0	0	1	1	0	1	0		 Background color	 Blank output	 Green Blue TV image of character background is not displayed.	No output (See note 2)
1	X	X	0	1	0	1	0		No output	 Border output (Black)	 Green Border output (Black) Video signal and character color (green) are not mixed.	No output (See note 2)
1	0	0	1	0	0	1	0		No output	 Blank output	 Green Black TV image of character background is not displayed.	No output (See note 2)
1	0	0	1	1	0	1	0		 Background color - border	 Blank output	 Green Border output (Black) Blue TV image of character background is not displayed.	No output (See note 2)

Notes 1 : When COi5 = "0" and COi4 = "1," there is output same as a character or border output from the OUT1 pin.

Do not set COi5 = "0" and COi4 = "0."

2 : When only COi7 = "1" and COi5 = "0," there is output from pin OUT2.

3 : The portion "A" in which character dots are displayed is not mixed with any TV video signal.

4 : The wavy-lined arrows in the Table denote video signals.

5 : n : 0 to 3, X : 0 or 1

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.10.6 Border

An border of 1 clock (1 dot) equivalent size can be added to a character to be displayed in both horizontal and vertical directions. The border is output from the OUT pin. In this case, set bit 5 of a color register to "0" (character is output).

Border can be specified in units of block by using the border selection register (address 00E5₁₆). Figure 8.10.14 shows the border selection register. Table 8.10.6 shows the relationship between the values set in the border selection register and the character border function.

Fig. 8.10.15 Example of Border

Border Selection Register

Border selection register (MD) [Address 00E5₁₆]

B	Name	Functions	After reset	R : W
0	Block 1 OUT1 output border selection bit (MD10)	0 : Same output as R, G, B is output 1 : Border output	Indeterminate	R : W
1	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R : —
2	Block 2 OUT1 output border selection bit (MD20)	0 : Same output as R, G, B is output 1 : Border output	Indeterminate	R : W
3 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R : —

Fig. 8.10.14 Border Selection Register

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.10.7 Multiline Display

This microcomputer can ordinarily display 2 lines on the CRT screen by displaying 2 blocks at different vertical positions. In addition, it can display up to 16 lines by using OSD interrupts.

An OSD interrupt request occurs at the point at which display of each block has been completed. In other words, when a scanning line reaches the point of the display position (specified by the vertical position registers) of a certain block, the character display of that block starts, and an interrupt occurs at the point at which the scanning line exceeds the block.

Note: An OSD interrupt does not occur at the end of display when the block is not displayed. In other words, if a block is set to off display by the display control bit of the CRT control register (address 00EA16), an OSD interrupt request does not occur (refer to Figure 8.10.16).

Fig. 8.10.16 Note on Occurrence of OSD Interrupt

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.10.8 OSD Output Pin Control

The OSD output pins R, G, B and OUT1 can also function as ports P52–P55. Set corresponding bit of the port P5 direction register (address 00CB16) to “0” to specify these pins as OSD output pins, or set it to “1” to specify it as a general-purpose port P5.

The OUT2 can also function as port P10. Set bit 0 of the CRT port control register (address 00EC16) to “1” (output mode). After that, set bit 7 of the CRT port control register to “1” to specify the pin as OSD output pin, or set it to “0” to specify as port P10.

The input polarity of the HSYNC, VSYNC and output polarity of signals R, G, B, OUT1 and OUT2 can be specified with the CRT port control register (address 00EC) . Set a bit to “0” to specify positive polarity; set it to “1” to specify negative polarity (refer to Figure 8.11.13).

The CRT port control register is shown in Figure 8.10.17.

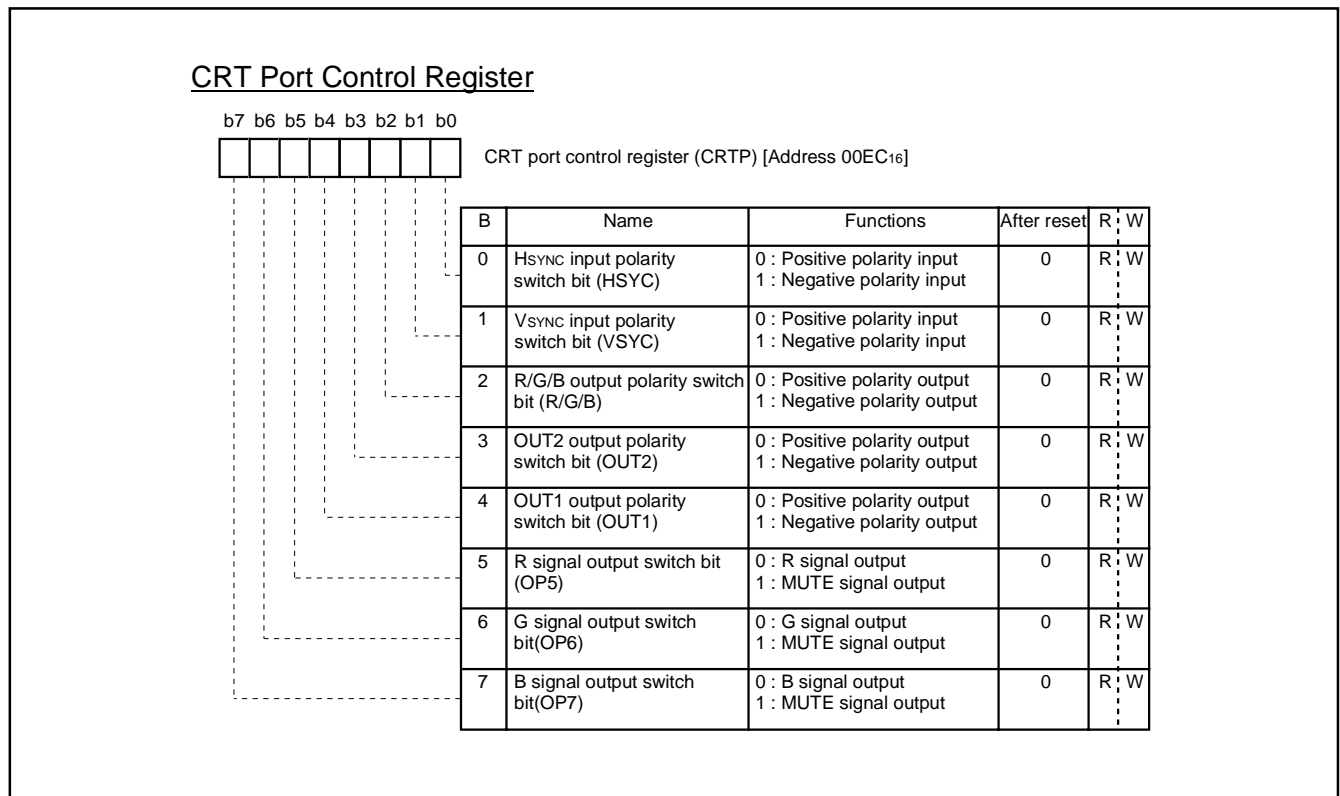

Fig. 8.10.17 CRT Port Control Register

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.10.9 Raster Coloring Function

An entire screen (raster) can be colored by setting the CRT port control register. Since each of the R, G, B, OUT1, and OUT2 pins can be switched to raster coloring output, 8 raster colors can be obtained.

When the character color/the character background color overlaps with the raster color, the color (R, G, B, OUT1, OUT2), specified for the character color/the character background color, takes priority of the raster color. This ensures that character color/character background color is not mixed with the raster color.

The example of raster coloring is shown in Figure 8.10.18.

Fig. 8.10.18 Example of Raster Coloring

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.11 SOFTWARE RUNAWAY DETECT FUNCTION

This microcomputer has a function to decode undefined instructions to detect a software runaway.

When an undefined op-code is input to the CPU as an instruction code during operation, the following processing is done.

- ① The CPU generates an undefined instruction decoding signal.
- ② The device is internally reset because of occurrence of the undefined instruction decoding signal.
- ③ As a result of internal reset, the same reset processing as in the case of ordinary reset operation is done, and the program restarts from the reset vector.

Note, however, that the software runaway detecting function cannot be invalid.

Fig. 8.11.1 Sequence at Detecting Software Runaway Detection

8.12. RESET CIRCUIT

When the oscillation of a quartz-crystal oscillator or a ceramic resonator is stable and the power source voltage is $5\text{ V} \pm 10\%$, hold the $\overline{\text{RESET}}$ pin at LOW for $2\text{ }\mu\text{s}$ or more, then return it to HIGH. Then, as shown in Figure 8.12.2, reset is released and the program starts from the address formed by using the content of address FFFF_{16} as the high-order address and the content of the address FFFE_{16} as the low-order address. The internal state of microcomputer at reset are shown in Figures 8.2.3 to 8.2.6.

An example of the reset circuit is shown in Figure 8.12.1.

The reset input voltage must be kept 0.6 V or less until the power source voltage surpasses 4.5 V .

Fig. 8.12.1 Example of Reset Circuit

Fig. 8.12.2 Reset Sequence

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.13 CLOCK GENERATING CIRCUIT

The built-in clock generating circuit is shown in Figure 8.13.3. When the STP instruction is executed, the internal clock ϕ stops at HIGH. At the same time, timers 3 and 4 are connected by hardware and "FF16" is set in timer 3 and "0716" is set in the timer 4. Select $f(X_{IN})/16$ as the timer 3 count source (set bit 0 of the timer mode register 2 to "0" before the execution of the STP instruction). Moreover, set the timer 3 and timer 4 interrupt enable bits to disabled ("0") before execution of the STP instruction). The oscillator restarts when external interrupt is accepted. However, the internal clock ϕ keeps its HIGH until timer 4 overflows, allowing time for oscillation stabilization when a ceramic resonator or a quartz-crystal oscillator is used.

When the WIT instruction is executed, the internal clock ϕ stops in the HIGH but the oscillator continues running. This wait state is released when an interrupt is accepted (See note). Since the oscillator does not stop, the next instruction can be executed at once.

When returning from the stop or the wait state, to accept an interrupt, set the corresponding interrupt enable bit to "1" before executing the STP or the WIT instructions.

Note: In the wait mode, the following interrupts are invalid.

- VSYNC interrupt
- OSD interrupt
- All timers interrupts using TIM2 and TIM3 pins input as count source
- All timers interrupts using $f(X_{IN})/2$ as count source
- All timers interrupts using $f(X_{IN})/4092$ as count source
- $f(X_{IN})/4096$ interrupt
- Multi-master I²C-BUS interface interrupt

A circuit example using a ceramic resonator (or a quartz-crystal oscillator) is shown in Figure 8.13.1. Use the circuit constants in accordance with the resonator manufacture's recommended values. A circuit example with external clock input is shown in Figure 8.13.2. Input the clock to the XIN pin, and open the XOUT pin.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER
with ON-SCREEN DISPLAY CONTROLLER

8.14 DISPLAY OSCILLATION CIRCUIT

The OSD oscillation circuit has a built-in clock oscillation circuits, so that a clock for OSD can be obtained simply by connecting an LC, an RC, a ceramic resonator, or a quartz-crystal oscillator across the pins OSC1 and OSC2. Which of the sub-clock or the OSD oscillation circuit is selected by setting bits 0 and 1 of the CRT clock selection register (address 00ED16).

Fig. 8.14.1 Display Oscillation Circuit

8.15 AUTO-CLEAR CIRCUIT

When a power source is supplied, the auto-clear function will operate by connecting the following circuit to the RESET pin.

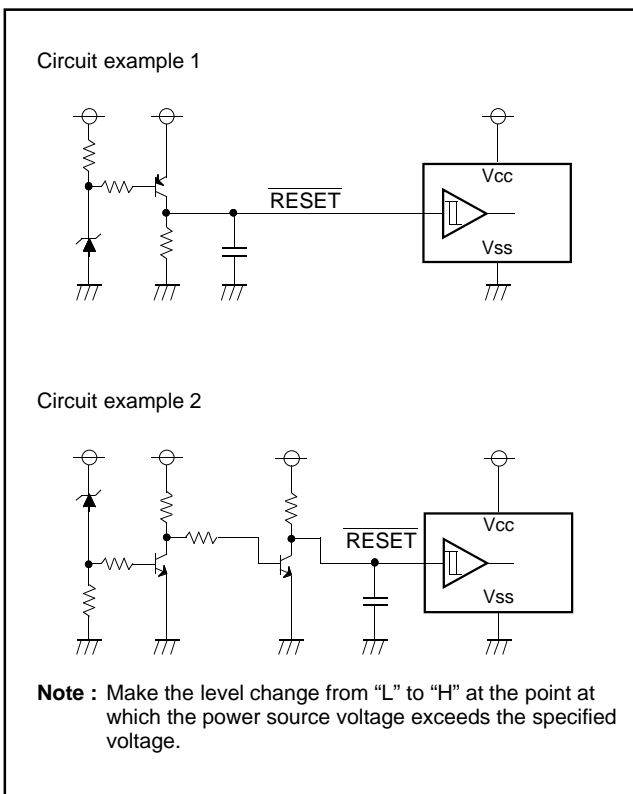

Fig. 8.15.1 Auto-clear Circuit Example

8.16 ADDRESSING MODE

The memory access is reinforced with 17 kinds of addressing modes. Refer to SERIES 740 <Software> User's Manual for details.

8.17 MACHINE INSTRUCTIONS

There are 71 machine instructions. Refer to SERIES 740 <Software> User's Manual for details.

9. PROGRAMMING NOTES

- The divide ratio of the timer is $1/(n+1)$.
- Even though the BBC and BBS instructions are executed immediately after the interrupt request bits are modified (by the program), those instructions are only valid for the contents before the modification. At least one instruction cycle is needed (such as an NOP) between the modification of the interrupt request bits and the execution of the BBC and BBS instructions.
- After the ADC and SBC instructions are executed (in the decimal mode), one instruction cycle (such as an NOP) is needed before the SEC, CLC, or CLD instruction is executed.
- An NOP instruction is needed immediately after the execution of a PLP instruction.
- In order to avoid noise and latch-up, connect a bypass capacitor ($\approx 0.1\mu\text{F}$) directly between the Vcc pin-Vss pin and the Vcc pin-CNVss pin, using a thick wire.

	LOW output voltage	P00-P07, P60-P63	VCC = 4.5 V IOL = 0.5 mA				0.4		
VT+ - VT-	Hysteresis	RESET	VCC = 5.0 V			0.5	0.7	V	3
	Hysteresis (See note 6)	HSYNC, VSYNC, TIM2, TIM3, INT1-INT3, SCL1, SCL2, SDA1, SDA2, SIN, SCLK	VCC = 5.0 V			0.5	1.3		
IIZH	HIGH input leak current	RESET, P10-P17, P20-P27, P30-P37, P40-P42, HSYNC, VSYNC	VCC = 5.5 V VI = 5.5 V				5	μA	4
IIZL	LOW input leak current	RESET, P00-P07, P10-P17, P20-P27, P30-P37, P40-P42, P60-P63, HSYNC, VSYNC	VCC = 5.5 V VI = 0 V				5	μA	
IOZH	HIGH input leak current	P00-P07, P60-P63	VCC = 5.5 V VI = 12 V				10	μA	5
RBS	I ² C-BUS-BUS switch connection resistor (between SCL1 and SCL2, SDA1 and SDA2)		VCC = 4.5 V				130	Ω	6

Notes 1: The total current that flows out of the IC must be 20 mA or less.

2: The total input current to IC (IOL1 + IOL2 + IOL3) must be 30 mA or less.

3: The total average input current for ports P24-P27 to IC must be 20 mA or less.

4: Connect 0.1 μF or more capacitor externally between the power source pins VCC-VSS so as to reduce power source noise.

Also connect 0.1 μF or more capacitor externally between the pins VCC-CNVSS.

5: Use a quartz-crystal oscillator or a ceramic resonator for the CPU oscillation circuit. When using the data slicer, use 8 MHz.

6: P15, P32-P35 have the hysteresis when these pins are used as interrupt input pins or timer input pins. P11-P14 have the hysteresis when these pins are used as multi-master I²C-BUS interface ports. P40-P42 have the hysteresis when these pins are used as serial I/O pins.

7: Pin names in each parameter is described as below.

(1) Dedicated pins: dedicated pin names.

(2) Double-/triple-function ports

- When the same limits: I/O port name.

- When the limits of functions except ports are different from I/O port limits: function pin name.

15. PROM PROGRAMMING METHOD

The built-in PROM of the One Time PROM version (blank) and the built-in EPROM version can be read or programmed with a general-purpose PROM programmer using a special programming adapter.

Product	Name of Programming Adapter
M37212EFSP	PCA7406
M37212EFPF	PCA7420

The PROM of the One Time PROM version (blank) is not tested or screened in the assembly process nor any following processes. To ensure proper operation after programming, the procedure shown in Figure 15.1 is recommended to verify programming.

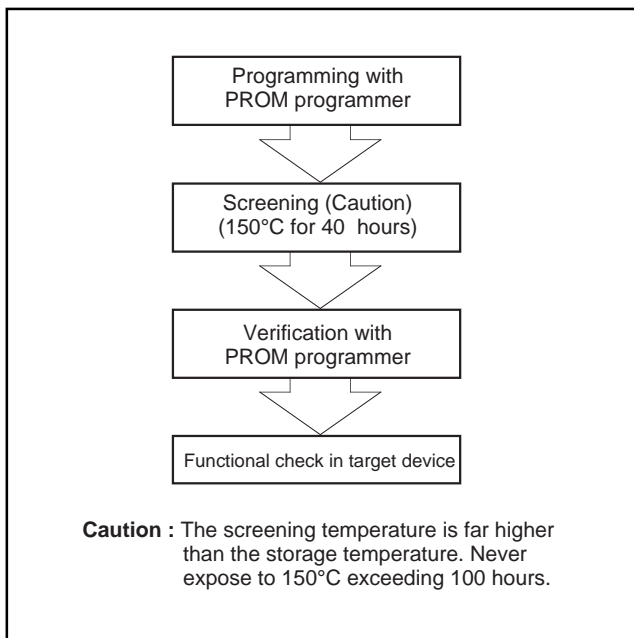

Fig. 15.1 Programming and Testing of One Time PROM Version

16. DATA REQUIRED FOR MASK ORDERS

The following are necessary when ordering a mask ROM production:

- Mask ROM Order Confirmation Form
- Mask Specification Form
- Data to be written to ROM, in EPROM form (32-pin DIP Type 27C101, three identical copies) or FDK

M37212M4/M8-XXXSP, M37212M6-XXXSP/FP M37212EFSP/FP

Three EPROMs are required for each pattern if this order is performed by EPROMs.
One floppy disk is required for each pattern if this order is performed by a floppy disk.

☐ Ordering by EPROMs

If at least two of the three sets of EPROMs submitted contain identical data, we will produce masks based on this data.
We shall assume the responsibility for errors only if the mask ROM data on the products we produce differs from this data. Thus, extreme care must be taken to verify the data in the submitted EPROMs.

Checksum code for entire EPROM

0007 ₁₆	'4' = 34 ₁₆	000F ₁₆	FF ₁₆

☐ Ordering by floppy disk

We will produce masks based on the mask files generated by the mask file generating utility. We shall assume the responsibility for errors only if the mask ROM data on the products we produce differs from this mask file. Thus, extreme care must be taken to verify the mask file in the submitted floppy disk.

The submitted floppy disk must be 3.5-inch 2HD type and DOS/V format. And the number of the mask files must be 1 in one floppy disk.

File code

18. MARK SPECIFICATION FORM

52P4B (52-PIN SHRINK DIP) MARK SPECIFICATION FORM

Mitsubishi IC catalog name

Please choose one of the marking types below (A, B, C), and enter the Mitsubishi IC catalog name and the special mark (if needed).

A. Standard Mitsubishi Mark

B. Customer's Parts Number + Mitsubishi Catalog Name

Note1: The mark field should be written right aligned.

2: The fonts and size of characters are standard Mitsubishi type.

3: Customer's parts number can be up to 18 characters:

Only 0~9, A~Z, +, -, /, (,), &, ©, . (period), and , (comma) are usable.

4: If the Mitsubishi logo is not required, check the box on the right.

☐ Mitsubishi logo is not required

C. Special Mark Required

Note1: If the special mark is to be printed, indicate the desired layout of the mark in the upper figure. The layout will be duplicated as close as possible. Mitsubishi lot number (6-digit or 7-digit) and mask ROM number (3-digit) are always marked.

2: If the customer's trade mark logo must be used in the special mark, check the box below. Please submit a clean original of the logo.

For the new special character fonts a clean font original (ideally logo drawing) must be submitted.

☐ Special logo required

The standard Mitsubishi font is used for all characters except for a logo.

80P6N (80-PIN QFP) MARK SPECIFICATION FORM

Mitsubishi IC catalog name

Please choose one of the marking types below (A, B, C), and enter the Mitsubishi IC catalog name and the special mark (if needed).

A. Standard Mitsubishi Mark

B. Customer's Parts Number + Mitsubishi IC Catalog Name

Customer's Parts Number

Note : The fonts and size of characters are standard Mitsubishi type.

Mitsubishi IC catalog name

Notes 1 : The mark field should be written right aligned.

2 : The fonts and size of characters are standard Mitsubishi type.

3 : Customer's parts number can be up to 14 alphanumeric characters for capital letters, hyphens, commas, periods and so on.

4 : If the Mitsubishi logo is not required, check the box below.

☐ Mitsubishi logo is not required

☐

C. Special Mark Required

Notes1 : If special mark is to be printed, indicate the desired layout of the mark in the left figure. The layout will be duplicated technically as close as possible.

Mitsubishi product number (6-digit, or 7-digit) and Mask ROM number (3-digit) are always marked for sorting the products.

2 : If special character fonts (e.g., customer's trade mark logo) must be used in Special Mark, check the box below.

For the new special character fonts, a clean font original (ideally logo drawing) must be submitted.

Special character fonts required

☐

Structure of Register

The figure of each register structure describes its functions, contents at reset, and attributes as follows:

<Example>

■ : Bit in which nothing is assigned

Notes 1: Values immediately after reset release

0 "0" after reset release

1 "1" after reset release

Indeterminate...Indeterminate after reset

release

2: Bit attributes.....The attributes of control register bits are classified into 3 types : read-only, write-only and read and write. In the figure, these attributes are represented as follows :

R.....Read

R.....Read enabled

–Read disabled

W.....Write

W.....Write enabled

–Write disabled

* "0" can be set by software, but "1" cannot be set.

Border selection register (MD) [Address 00E5₁₆]

B	Name	Functions	After reset	R	W
0	Block 1 OUT1 output border selection bit (MD10)	0 : Same output as R, G, B is output 1 : Border output	Indeterminate	R	W
1	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R	—
2	Block 2 OUT1 output border selection bit (MD20)	0 : Same output as R, G, B is output 1 : Border output	Indeterminate	R	W
3 to 7	Nothing is assigned. These bits are write disable bits. When these bits are read out, the values are "0."		0	R	—

Addresses 00E6₁₆ to 00E9₁₆

Color Register i

Color register i (COi) (i = 0 to 3) [Addresses 00E6₁₆ to 00E9₁₆]

B	Name @	Functions	After reset	R	W
0	Nothing is assigned. This bit is a write disable bit. When this bit is read out, the value is "0."		0	R	—
1	B signal output selection bit (COi1)	0: No character is output 1: Character is output	Indeterminate	R	W
2	G signal output selection bit (COi2)	0: No character is output 1: Character is output	Indeterminate	R	W
3	R signal output selection bit (COi3)	0: No character is output 1: Character is output	Indeterminate	R	W
4	B signal output (background) selection bit (COi4) (See note 1)	0: No background color is output 1: Background color is output	Indeterminate	R	W
5	OUT1 signal output control bit (COi5) (See notes 1, 2)	0: Character is output 1: Blank is output	Indeterminate	R	W
6	G signal output (background) selection bit (COi6) (See note 1)	0: No background color is output 1: Background color is output	Indeterminate	R	W
7	R signal output (background) selection bit (COi7) (See note 2)	0: No background color is output 1: Background color is output	Indeterminate	R	W

Notes 1: When bit 5 = "0" and bit 4 = "1," there is output same as a character or border output from pin OUT1.
Do not set bit 5 = "0" and bit 4 = "0."
2: When only bit 7 = "1" and bit 5 "0," there is output from pin OUT2.

0 0 0 0 0 0 0 0

CRT clock selection register (CK) [Address 00ED₁₆]

B	Name			Functions	After reset	R	W	
0, 1	CRT clock selection bits (CK0,CK1)	b1	b0	Functions		0	R	W
		0	0	The clock for display is supplied by connecting RC or LC across the pins OSC1 and OSC2.				
		0	1	Since the main clock is used as the clock for display, the oscillation frequency is limited. Because of this, the character size in width (horizontal) direction is also limited. In this case, pins OSC1 and OSC2 are also used as input ports P3 ₆ and P3 ₇ respectively,	OSD oscillation frequency = f(X _{IN})			
		1	0		OSD oscillation frequency = f(X _{IN})/1.5			
		1	1	The clock for OSD is supplied by connecting the following across the pins OSC1 and OSC2. <ul style="list-style-type: none">• a ceramic resonator only for OSD and a feedback resistor• a quartz-crystal oscillator only for OSD and a feedback resistor (See note)				
2 to 7	Fix these bits to "0."				0	R	W	

Note: It is necessary to connect other ceramic resonator or quartz-crystal oscillator across the pins X_{IN} and X_{OUT}.

Keep safety first in your circuit designs!

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
- The information described here may contain technical inaccuracies or typographical errors. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors. Please also pay attention to information published by Mitsubishi Electric Corporation by various means, including the Mitsubishi Semiconductor home page (<http://www.mitsubishichips.com>).
- When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
- Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
