DESCRIPTION

The M37450S1SP/FP is a single-chip microcomputer designed with CMOS silicon gate technology. It is housed in a 64-pin shrink plastic molded DIP or an 80-pin plastic molded QFP. In addition to its simple instruction sets, the ROM, RAM and I/O addresses are placed on the same memory map to enable easy programming. It is suited for office automation equipment and control devices. The low power consumption made possible by the use of a CMOS process makes it especially suitable for battery powered devices requiring low power consumption. It also has a unique feature that enables it to be used as a slave microcomputer.

M37450S1SP/FP, M37450S2SP/FP and M37450S4SP/FP have basically the same functions as M37450M2-XXXSP/FP except the RAM size and the fact that these three need external ROM area. The differences among M37450S1SP/FP, M37450S2SP/FP and M37450S4SP/FP are as shown below.

PIN DESCRIPTION

Pin	Name	Input/ Output	Functions
V _{CC} , V _{SS}	Supply voltage		Power supply inputs 5V±10% to V _{CC} , and 0V to V _{SS} .
CNV _{SS}	CNV _{SS}	Input	This is connected to V _{CC} .
RESET	Reset input	Input	To enter the reset state, the reset input pin must be kept at a "L" for more than 8 clock cycles (under normal V _{CC} conditions). If more time is needed for the crystal oscillator to stabilize, this "L" condition should be maintained for the required time.
X _{IN}	Clock input	Input	This chip has an internal clock generating circuit. To control generating frequency, an external ceramic or a quartz crystal oscillator is connected between the X _{IN} and X _{OUT} pins. If an external clock is used, the clock source should be connected to the X _{IN} pin and the X _{OUT} pin should be left open.
X _{OUT}	Clock output	Output	
φ	Timing output	Output	Outputs signal consisting of oscillating frequency divided by four.
SYNC	Synchronous signal output	Output	This signal is output "H" during operation code fetch and is used to control single stepping of programs.
R/W	Read/Write status output	Output	This signal determines the direction of the data bus. It is "H" during read and "L" during write.
A ₀ ~A ₁₅	Address bus	Output	This is 16-bit address bus.
D ₀ ~D ₇	Data bus	I/O	This is 8-bit data bus.
P ₃₀ ~P ₃₇	Input/Output port P3	I/O	Port P3 is an 8-bit I/O port with directional registers allowing each I/O bit to be individually programmed as input or output. The output structure is CMOS output. Serial I/O, PWM output, or even I/O function can be selected with a program.
P ₄₀ ~P ₄₂ (P ₄₀ ~P ₄₇)	Input port P4	Input	Analog input pin for the A-D converter. The 64-pin model has three pins and the 80-pin model has eight pins. They may also be used as digital input pins.
P ₅₀ ~P ₅₇	Input/Output port P5	I/O	An 8-bit input/output port with the same function as P3. This port functions as an 8-bit data bus for the master CPU when slave mode is selected with a program.
P ₆₀ ~P ₆₇	Input/Output port P6	I/O	An 8-bit input/output port with the same function as P0. Pins P ₆₃ ~P ₆₇ change to a control bus for the master CPU when slave mode is selected with a program. Pins P ₆₀ ~P ₆₂ may be programmed as external interrupt input pins.
D-A ₁ , D-A ₂	D-A output	Output	Analog signal from D-A converter is output.
V _{REF}	Reference voltage input	Input	Reference voltage input pin for A-D and D-A converter. This pin is for 64-pin model only.
ADV _{REF}	A-D reference voltage input	Input	Reference voltage input pin for A-D converter. This pin is for 80-pin model only.
DAV _{REF}	D-A reference voltage input	Input	Reference voltage input pin for D-A converter. This pin is for 80-pin model only.
AV _{SS}	Analog power supply		Ground level input pin for A-D and D-A converter. Same voltage as V _{SS} is applied.
AV _{CC}	Analog power supply		Power supply input pin for A-D converter. This pin is for 80-pin model only. Same voltage as V _{CC} is applied. In the case of the 64-pin model AV _{CC} is connected to V _{CC} internally.

WR	Write signal output	Output	Control signal output as active "L" when writing data from data bus to external component. This pin is for 80-pin model only.
RESET _{OUT}	Reset output	Output	Control signal output as active "H" during reset. It is used as a reset output signal for peripheral components. This pin is for 80-pin model only.

BASIC FUNCTION BLOCKS

The differences between M37450M2-XXXSP/FP and M374-50S1SP/FP are noted below. Other functions are the same as M37450M2-XXXSP/FP in microprocessor mode.

MEMORY

A memory map for the M37450S1SP/FP is shown in Figure 1. Addresses $FF00_{16}$ to $FFFF_{16}$ are a special address area (special page). By using the special page addressing mode of the JSR instruction, subroutines addressed on this page can be called with only 2 bytes. Addresses $FEE0_{16}$ to $FFFF_{16}$ are vector addresses used for the reset and interrupts (This area must be located in ROM area). Addresses 0000_{16} ~ $00FF_{16}$ are the zero page address area.

By using the zero page addressing mode, this area can also be accessed with 2 bytes. The use of these addressing methods will greatly reduce the object size required. The RAM, I/O port, timer, etc., are assigned to this area. Addresses 0000_{16} to $007F_{16}$ are the RAM address area assigned to the M37450S1SP/FP and consist of 128 bytes. Addresses 0000_{16} to $00BF_{16}$ and 0100_{16} to $013F_{16}$ are the RAM address area assigned to the M37450S2SP/FP and consist of 192 bytes and 64 bytes respectively. Addresses 0000_{16} to $00BF_{16}$ and 0100_{16} to $01FF_{16}$ are the RAM address area assigned to the M37450S4SP/FP and consist of 192 bytes and 256 bytes respectively. In addition to data storage, this RAM is used for the stack during subroutine calls and interrupts.
