Note: *1 Design assurance value

Note: *2 Output voltage: V_{OUT}
Terminal voltage at the time of $T_a=-25^{\circ}C$, $30^{\circ}C$ and $100^{\circ}C$.

Note: *3 Temperature Sensitivity: V_{SE}
Temperature coefficient of output voltage calculated from output voltage at the time of $T_a=-25^{\circ}C$ and $+100^{\circ}C$.
$$V_{SE}=(V_{OUT}(100^{\circ}C)-V_{OUT}(-25^{\circ}C))/125$$

Note: *4 Nonlinearity: Δ NL

Characteristic curve of output voltage and deflection with the approximation straight line.

In temperature range from -25 to $+100^{\circ}\text{C}$, the approximation straight line and the maximum deflection of the temperature of the measurement value among output voltages obtained from the approximation straight line. It assumes the approximation straight line to be a straight line to which a is minimized.
