

CMOS Regulator Monolithic IC MM324□□ Series

Outline

MM327X is a regulator IC that high ripple eliminant rate (80dB), and has been developed using the CMOS process. Moreover, in addition to characteristics such as low current consumption and low dropout voltage, it supports long lifetime of batteries with a chip enable function.

The mount area is set to 1.10x1.40mm using a surface mount type leadless 4pin package, which realizes microminiaturization.

Features

- | | |
|----------------------------|------------------|
| 1. Input Voltage Range | 2~6V |
| 2. Output Voltage Range | 1.5~5.5V |
| 3. Output Voltage accuracy | ±1% |
| 4. Maximum Output Current | 150mA |
| 5. Supply Current | 10μA typ. |
| 6. Dropout Voltage | 0.06mV max. |
| 7. Ripple elimination rate | High:ON, Low:OFF |

Package

MLF-4
 SOT-25

Applications

1. Cellular Phone
2. Portable Game Device
3. Portable Information Terminal
4. Digital Cameras
5. Note PCs

Measuring Circuit

Typical Application Circuit

★Temperature Characteristics: B

(reference example of external parts)

- Output Capacitor Ceramic Capacitor 0.1 μ F
- Input Capacitor Ceramic Capacitor 0.1 μ F

Note

1. The output capacitor is required between output and GND to prevent oscillation.
2. The ESR of capacitor must be defined in ESR stability area.
It is possible to use a ceramic capacitor without ESR resistance for output.
The ceramic capacitor must be used more than 0.1 μ F and B temperature characteristics.
3. The wire of V_{CC} and GND is required to print full ground plane for noise and stability.
4. The input capacitor must be connected a distance of less than 1cm from input pin.
5. In case the output voltage is above the input voltage, the overcurrent flow by internal parasitic diode from output to input.
