

÷2, ÷4/6 Clock Generation Chip

The MC100LVEL38 is a low skew ÷2, ÷4/6 clock generation chip designed explicitly for low skew clock generation applications. The MC100EL38 is pin and functionally equivalent to the MC100LVEL38 but is specified for operation at the standard 100K ECL voltage supply. The internal dividers are synchronous to each other, therefore, the common output edges are all precisely aligned. The device can be driven by either a differential or single-ended LVECL or, if positive power supplies are used, LVPECL input signal. In addition, by using the V_{BB} output, a sinusoidal source can be AC coupled into the device (see Interfacing section of the ECLinPS™ Data Book DL140/D). If a single-ended input is to be used, the V_{BB} output should be connected to the CLK input and bypassed to ground via a 0.01μF capacitor. The V_{BB} output is designed to act as the switching reference for the input of the LVEL38 under single-ended input conditions, as a result, this pin can only source/sink up to 0.5mA of current.

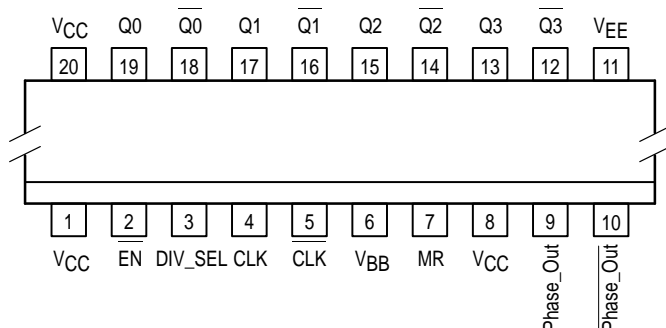

The common enable (\overline{EN}) is synchronous so that the internal dividers will only be enabled/disabled when the internal clock is already in the LOW state. This avoids any chance of generating a runt clock pulse on the internal clock when the device is enabled/disabled as can happen with an asynchronous control. An internal runt pulse could lead to losing synchronization between the internal divider stages. The internal enable flip-flop is clocked on the falling edge of the input clock, therefore, all associated specification limits are referenced to the negative edge of the clock input.

The Phase_Out output will go HIGH for one clock cycle whenever the ÷2 and the ÷4/6 outputs are both transitioning from a LOW to a HIGH. This output allows for clock synchronization within the system.

Upon startup, the internal flip-flops will attain a random state; therefore, for systems which utilize multiple LVEL38s, the master reset (MR) input must be asserted to ensure synchronization. For systems which only use one LVEL38, the MR pin need not be exercised as the internal divider design ensures synchronization between the ÷2 and the ÷4/6 outputs of a single device.

- 50ps Output-to-Output Skew
- Synchronous Enable/Disable
- Master Reset for Synchronization
- 75kΩ Internal Input Pulldown Resistors
- >1500V ESD Protection
- Low Voltage V_{EE} Range of -3.0 to -3.8V

Pinout: 20-Lead SOIC (Top View)

PIN DESCRIPTION

PIN	FUNCTION
CLK	Diff Clock Inputs
EN	Sync Enable
MR	Master Reset
V_{BB}	Reference Output
Q ₀ , Q ₁	Diff ÷2 Outputs
Q ₂ , Q ₃	Diff ÷4/6 Outputs
DIVSEL	Frequency Select Input
Phase_Out	Phase Sync Signal

FUNCTION TABLE

CLK	\overline{EN}	MR	FUNCTION
Z	L	L	Divide
ZZ	H	L	Hold Q ₀₋₃
X	X	H	Reset Q ₀₋₃

Z = Low-to-High Transition

ZZ = High-to-Low Transition

DIVSEL	Q ₂ , Q ₃ OUTPUTS
0	Divide by 4
1	Divide by 6

1. Skew is measured between outputs under identical transitions.

2. Minimum input swing for which AC parameters are guaranteed. The device will function reliably with differential inputs down to 100mV.

3. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between $V_{PP\ Min}$ and 1.0V. The lower end of the CMR range is dependent on V_{EE} and is equal to $V_{EE} + 1.65V$.
