

## VR4121™

### 64-/32-BIT MICROPROCESSOR

#### DESCRIPTION

The  $\mu$ PD30121 (VR4121) is one of NEC's VR Series™ RISC (Reduced Instruction Set Computer) microprocessors and is a high-performance 64-/32-bit microprocessor employing the MIPS™ RISC architecture.

The VR4121 uses the high-performance, super power-saving VR4120™ as the CPU core, and has many peripheral functions such as a DMA controller, software modem interface, serial interface, keyboard interface, IrDA interface, touch panel interface, real-time clock, A/D converter, and D/A converter. Configured with these functions, the VR4121 is suitable for high-speed battery-driven portable information systems. The external memory bus width can be selected from 32 bits and 16 bits, realizing high-speed data transfer.

Detailed function descriptions are provided in the following user's manual. Be sure to read it before designing.

- VR4121 User's Manual (U13569E)

#### FEATURES

- Employs 64-bit MIPS architecture
  - Conforms to MIPS III instruction set (deleting FPU, LL, LLD, SC, and SCD instructions)
  - Optimized 6-stage pipeline
- Supports MIPS16 instruction set
- Supports high-speed product-sum operation instructions
- Supports four types of operating modes, enabling more effective power-consumption management
- Internal maximum operating frequency: 131/168 MHz
- On-chip clock generator
- Address space
  - physical: 32 bits
  - virtual: 40 bits
 Integrates 32 double entry TLBs
- High-capacity instruction/data separated cache memories
  - Instruction: 16 Kbytes
  - Data: 8 Kbytes
- Memory controller (ROM, EDO-type DRAM, synchronous DRAM (SDRAM), synchronous ROM (SROM), and flash memory supported)
- Keyboard interface and touch panel interface
- 4-channel DMA controller
- Serial interface (NS16550 compatible)
- IrDA interface for infrared communication
- Software modem interface
- A/D and D/A converters to support digital voice I/O
- Supports ISA bus subset
- Power supply voltage:  $V_{DD2} = 2.5$  V (internal),  $V_{DD3} = 3.3$  V (external) (131 MHz model)
- Package: 224-pin fine-pitch FBGA

#### APPLICATIONS

- Battery-driven portable information systems
- Embedded controllers, etc.

#### ORDERING INFORMATION

### 1.1 Pin Functions

#### (1) System bus interface signals

(1/3)

Signal	I/O	Function
ADD25/SCLK	O	This function differs depending on how the SMODE (1:2) signal is set. <When SMODE (1:2) signal = 00> This is a 25-bit address bus. <When SMODE (1:2) signal ≠ 00> This is the operating clock for SDRAM and SROM.
ADD (0:24)	O	This is a 25-bit address bus. The V <sub>R</sub> 4121 uses this to specify addresses for the SDRAM, SROM, DRAM, ROM, LCD, or system bus (ISA).
DATA (0:15)	I/O	This is a 16-bit data bus. The V <sub>R</sub> 4121 uses this to transmit and receive data with a SDRAM, SROM, DRAM, ROM, LCD, or system bus.
DATA (16:31)/ GPIO (16:31)	I/O	This function differs depending on how the DBUS32 signal is set. <When DBUS32 signal = 1> This is the high-order 16 bits of the 32-bit data bus. This bus is used for transmitting and receiving data between the V <sub>R</sub> 4121 and the DRAM and ROM. <When DBUS32 signal = 0> This is a general-purpose I/O port.
LDCS#	O	This is the LCD chip select signal. This signal is active when the V <sub>R</sub> 4121 is performing LCD access and high-speed system bus access using the ADD/DATA bus.
RD#	O	This is active when the V <sub>R</sub> 4121 is reading data from the LCD, SDRAM, SROM, DRAM, or ROM.
WR#	O	This is active when the V <sub>R</sub> 4121 is writing data to the LCD, SDRAM, or DRAM.
LCDRDY	I	This is the LCD ready signal. Set this signal as active when the LCD controller is ready to receive access from the V <sub>R</sub> 4121.
ROMCS (2:3)#	O	The function differs with the setting of the DBUS32 signal. <When DBUS32 signal = 1> This becomes the chip select signal for the extended ROM, SROM, DRAM, or SDRAM. <When DBUS32 signal = 0> This is the ROM or SROM chip select signal.
ROMCS (0:1)#	O	This is the ROM or SROM chip select signal.
CKE	O	This is the SDRAM or SROM clock enable signal. When using neither SDRAM nor SROM, connect to GND or leave open.
UUCAS#/ MRAS3#	O	This function differs depending on how the DBUS32 signal is set or types of memory to be accessed. <When DBUS32 signal = 1> When accessing DRAM (EDO type): This signal is active (UUCAS#) when a valid column address is output via the ADD bus during access of DATA (24:31) in the 32-bit data bus. When accessing SDRAM: This is the I/O buffer control signal (UUDQM#) that is used during access of DATA (24:31) signal in the 32 bit data bus. During 32-bit access of LCD/high-speed system memory: Byte enable signal that is used during access of DATA (24:31) signal. <When DBUS32 signal = 0> When accessing DRAM (EDO type): This is the DRAM's RAS signal (MRAS3#). This signal is active when a valid row address is output via the ADD bus for the DRAM connected to the high-order address. When accessing SDRAM: This is the SDRAM's chip select signal (CS3#). This signal is active when a command is issued for the SDRAM connected to the high-order address.

(2/3)

Signal	I/O	Function
ULCAS#/ MRAS2#	O	<p>This function differs depending on how the DBUS32 signal is set and type of memory being accessed.</p> <p>&lt;When DBUS32 signal = 1&gt;            When accessing DRAM (EDO type): This signal is active (ULCAS#) when a valid column address is output via the ADD bus during access of DATA (16:23) signal in the 32-bit data bus.            When accessing SRAM: This is the I/O buffer control signal (ULDQM#) that is used during access of DATA (16:23) signal in the 32-bit data bus.            During 32-bit access of LCD/high-speed system memory: Byte enable signal that is used during access of DATA (16:23) signal.</p> <p>&lt;When DBUS32 signal = 0&gt;            When accessing DRAM (EDO type): This is the DRAM's RAS signal (MRAS2#). This signal is active when a valid row address is output via the ADD bus for the DRAM connected to the next highest address after the highest high-order address.            When accessing SDRAM: This is the SDRAM's chip select signal (CS2#). This signal is active when a command is issued for the SDRAM connected to the second highest high-order address.</p>
MRAS (0:1)#	O	<p>This function differs depending on the type of memory being accessed.</p> <p>&lt;When accessing DRAM (EDO type)&gt;            This is the DRAM's RAS-only signal.</p> <p>&lt;When accessing SDRAM&gt;            This is the SDRAM's chip select signal (CS (0:1)#).</p>
UCAS#	O	<p>This function differs depending on the type of memory being accessed.</p> <p>&lt;When accessing DRAM (EDO type)&gt;            This is the DRAM's CAS signal. This signal is active when a valid column address is output via the ADD bus during access of DATA (8:15) signal in the DRAM.</p> <p>&lt;When accessing SDRAM&gt;            This is the I/O buffer control signal (UDQM#) that is used during access of DATA (8:15) signal.</p> <p>&lt; During 32-bit access of LCD/high-speed system memory &gt;            This is the byte enable signal that is used during access of DATA (8:15) signal. This signal is active when a valid address is output via the ADD bus for access to DATA (8:15) signal when the size of the access bus to the LCD is 32 bits.</p>
LCAS#	O	<p>This function differs depending on the type of memory being accessed.</p> <p>&lt;When accessing DRAM (EDO type)&gt;            This is the DRAM's CAS signal. This signal is active when a valid column address is output via the ADD bus during access of DATA (0:7) signal in the DRAM.</p> <p>&lt;When accessing SDRAM&gt;            This is the I/O buffer control signal (LDQM#) that is used during access of DATA (0:7) signal.</p> <p>&lt; During 32-bit access of LCD/high-speed system memory &gt;            This is the byte enable signal that is used during access of DATA (0:7) signal.</p>
BUSCLK	O	<p>This is the system bus clock. It is used to output the clock that is supplied to the controller on the system bus. Its frequency is determined based on the status of the CLKSEL (0:2) signal. Ordinarily, the frequency is 1/4 of the TClock frequency. (See <b>(5) RS-232C interface signals</b>). The frequency can be changed via the PMU register settings.</p>
SHB#	O	<p>This is the system bus high-byte enable signal. During 16-bit system bus access, this signal is active when the high-order byte is valid on the data bus.</p>
IOR#	O	<p>This is the system bus I/O read signal. It is active when the V<sub>R</sub>4121 accesses the system bus to read data from an I/O port.</p>
IOW#	O	<p>This is the system bus I/O write signal. It is active when the V<sub>R</sub>4121 accesses the system bus to write data to an I/O port.</p>
MEMR#	O	<p>This is the system bus memory read signal. It is active when the V<sub>R</sub>4121 accesses the system bus to read data from memory.</p>
MEMW#	O	<p>This is the system bus memory write signal. It is active when the V<sub>R</sub>4121 accesses the system bus to write data to memory.</p>
ZWS#	I	<p>This is the system bus zero wait state signal. Set this signal as active to enable the controller on the system bus to be accessed by the V<sub>R</sub>4121 without a wait interval.</p>

(3/3)

Signal	I/O	Function
RSTOUT	O	This is the system bus reset signal. It is active when the V <sub>R</sub> 4121 resets the system bus controller (during bus timeout, manipulation of BCUCNTREG1 register, and power-down mode).
MEMCS16#	I	This is a dynamic bus sizing request signal. Set this signal as active when system bus memory accesses data in 16-bit width. This signal is invalid when 32-bit width is selected using LCD/high-speed system bus.
IOCS16#	I	This is a dynamic bus sizing request signal. Set this signal as active when system bus I/O accesses data in 16-bit width. This signal is invalid when 32-bit width is selected using LCD/high-speed system bus.
IOCHRDY	I	This is the system bus ready signal. Set this signal as active when the system bus controller is ready to be accessed by the V <sub>R</sub> 4121.
HLDRQ#	I	This is a hold request signal for the system bus and DRAM bus that is sent from an external bus master.
HLDAK#	O	This is a hold acknowledge signal for the system bus and DRAM bus that is sent to an external bus master.
SRAS#/GPIO4	I/O	This function differs depending on the type of memory being accessed. <When accessing DRAM (EDO type)> This is a general-purpose I/O port. <When accessing SDRAM> This is the RAS signal for SDRAM and SROM only.
SCAS#/GPIO5	I/O	This function differs depending on the type of memory being accessed. <When accessing DRAM (EDO type)> This is a general-purpose I/O port. <When accessing SDRAM> This is the CAS signal for SDRAM and SROM only.
SYSDIR#/GPIO6	I/O	This function differs depending on the type of memory being accessed. <When accessing DRAM (EDO type)> This is a general-purpose I/O port. <When accessing SDRAM> This is the direction control signal for the buffer used to reduce the DATA bus's load.
SPOWER/ GPIO7	I/O	This function differs depending on the type of memory being accessed. <When accessing DRAM (EDO type)> This is a general-purpose I/O port. <When accessing SDRAM> This is the SDRAM's power supply control signal.

## (2) Clock interface signals

Signal	I/O	Function
RTCX1	I	This is the 32.768-kHz oscillator's input pin. It is connected to one side of a crystal resonator.
RTCX2	O	This is the 32.768-kHz oscillator's output pin. It is connected to one side of a crystal resonator.
CLKX1	I	This is the 18.432-MHz oscillator's input pin. It is connected to one side of a crystal resonator.
CLKX2	O	This is the 18.432-MHz oscillator's output pin. It is connected to one side of a crystal resonator.
FIRCLK	I	This is the 48-MHz clock input pin. Fix this at high level when FIR is not used.

### (3) Battery monitor interface signals

Signal	I/O	Function
BATTINH/ BATTINT#	I	<p>This function differs depending on how the MPOWER signal is set.</p> <p>&lt;When MPOWER signal = 0&gt;</p> <p>BATTINH function</p> <p>This signal enables/prohibits activation due to power-on.</p> <p>1 : Enable activation</p> <p>0 : Prohibit activation</p> <p>&lt;When MPOWER signal = 1&gt;</p> <p>BATTINT# function</p> <p>This is an interrupt signal that is output when remaining power is low during normal operations. The external agent checks the remaining battery power. Activate the signal at this pin if voltage sufficient for operations cannot be supplied.</p>

### (4) Initialization interface signals

Signal	I/O	Function
MPOWER	O	This signal indicates the V <sub>R4121</sub> is operating. This signal is inactive during Hibernate mode.
POWERON	O	This signal indicates the V <sub>R4121</sub> is ready to operate. It becomes active when a power-on factor is detected and becomes inactive when the BATTINH/BATTINT# signal check operation is completed.
POWER	I	This is a V <sub>R4121</sub> activation signal.
RSTSW#	I	This is a V <sub>R4121</sub> reset signal.
RTCST#	I	This signal resets RTC. When power is first supplied to a device, the external agent must assert the signal at this pin for about 2 s.

(5) RS-232C interface signals

Signal	I/O	Function																																																												
RxD	I	This is a receive data signal. It is used when the RS-232C controller sends serial data to the V <sub>R</sub> 4121.																																																												
CTS#	I	This is a transmit enable signal. Assert this signal when the RS-232C controller is ready to receive transmission of serial data.																																																												
DCD#/ GPIO15	I	This is a carrier detection signal. Assert this signal when valid serial data is being received. It is also used when detecting a power-on factor for the V <sub>R</sub> 4121.  When this pin is not used for DCD# signal, this pin can be used as an interrupt detection function for the GIU unit.																																																												
DSR#	I	This is the data set ready signal. Assert this signal when the RS-232C controller is ready to receive/transmit serial data between the controller and the V <sub>R</sub> 4121.																																																												
TxD/ CLKSEL2,  RTS#/ CLKSEL1,  DTR#/ CLKSEL0	I/O	<p>This function differs depending on the operating status.</p> <p>&lt;During normal operation (output)&gt;     Signals used for serial communication         TxD signal :             This is a transmit data signal. **(6) IrDA interface signals**

Signal	I/O	Function
IRDIN	I	This is an IrDA serial data input signal. It is used when the V <sub>R</sub> 4121 sends serial data to the IrDA controller, for both FIR and SIR. If the IrDA controller used is an HP product, however, this signal should be used for only SIR.
FIRDIN#/SEL	I/O	This function differs according to the IrDA controller used. <HP's controller> FIRDIN#: It is an FIR receive data input signal. <TEMIC's controller> SEL: It is an output port for external FIR/SIR switching. <SHARP's controller> Use is prohibited.
IRDOUT#	O	This is the IrDA serial data output signal. It is used when the IrDA controller sends serial data from the V <sub>R</sub> 4121.

**(7) Debug serial interface signals**

Signal	I/O	Function
DDOUT/ GPIO44	O	This is the debug serial data output signal. It is used when the V <sub>R</sub> 4121 sends serial data to an external debug serial controller. When this pin is not used for the DDOUT signal, it can be used as a general-purpose output port.
DDIN/ GPIO45	I/O	This is the debug serial data input signal. It is used when an external debug serial data controller sends serial data to the V <sub>R</sub> 4121. When this pin is not used for the DDIN signal, it can be used as a general-purpose output port.
DRTS#/ GPIO46	O	This is a transmission request signal. The V <sub>R</sub> 4121 asserts this signal before sending serial data. When this pin is not used for the DRTS# signal, it can be used as a general-purpose output port.
DCTS#/ GPIO47	I/O	This is a transmit acknowledge signal. The V <sub>R</sub> 4121 asserts this signal when it is ready to receive transmitted serial data. When this pin is not used for the DCTS# signal, it can be used as a general-purpose output port.

**(8) Keyboard interface signals**

Signal	I/O	Function
KPORT (0:7)	I	This is a keyboard scan data input signal. It is used to scan for pressed keys on the keyboard.
KSCAN (0:11)/ GPIO (32:43)	O	These signal are used as keyboard scan data output signals and a general-purpose output port. The scan line is set as active when scanning for pressed keys on the keyboard. Signals that are not used for KSCAN signals can be used as a general-purpose output port.

**(9) Audio interface signals**

Signal	I/O	Function
AUDIOIN	I	This pin is the audio input signal.
AUDIOOUT	O	This is an audio output signal. Analog signals that have been converted via the on-chip 10-bit D/A converter are output.

**(10) Touch panel/general purpose A/D interface signals**

Signal	I/O	Function
TPX (0:1)	I/O	This is an I/O signal that is used for the touch panel. It uses the voltage applied to the X coordinate and the voltage input to the Y coordinate to detect which coordinates on the touch panel are being pressed.
TPY (0:1)	I/O	This is an I/O signal that is used for the touch panel. It uses the voltage applied to the Y coordinate and the voltage input to the X coordinate to detect which coordinates on the touch panel are being pressed.
ADIN (0:2)	I	This is a general-purpose A/D input signal.

**(11) General-purpose I/O Signals**

Signal	I/O	Function
GPIO (0:3)	I/O	These are maskable power-on factors. After start-up, they are used as ordinary general-purpose I/O ports.
GPIO4/SRAS#	I/O	See <b>(1) System bus interface signals.</b>
GPIO5/SCAS#	I/O	See <b>(1) System bus interface signals.</b>
GPIO6/SYSDIR	I/O	See <b>(1) System bus interface signals.</b>
GPIO7/SPOWER	I/O	See <b>(1) System bus interface signals.</b>
GPIO8	I/O	These are general-purpose I/O ports.
GPIO (9:12)	I/O	These are maskable power-on factors. After start-up, they are used as ordinary general-purpose I/O ports.
GPIO (13:14)	I/O	These are general-purpose I/O ports.
GPIO (16:31)/DATA (16:31)	I/O	See <b>(1) System bus interface signals.</b>
GPIO (32:43)/KSCAN (0:11)	O	See <b>(8) Keyboard interface signals.</b>
GPIO44/DDOUT	O	See <b>(7) Debug serial interface signals.</b>
GPIO45/DDIN	I/O	See <b>(7) Debug serial interface signals.</b>
GPIO46/DRTS#	O	See <b>(7) Debug serial interface signals.</b>

GPIO49/SMODE1	I/O	See <b>(14) Initial setting signals.</b>

**(12) HSP MODEM interface signals**

Signal	I/O	Function
IRING	I	RING signal detect signal. This pin becomes active when the RING signal is detected.
ILCSENSE	I	Handset detect signal
OFFHOOK	O	On-hook relay control signal
MUTE	O	Modem speaker mute control signal
AFERST#	O	CODEC reset signal
SDI	I	Serial input signal from CODEC
FS	I	Frame synchronization signal from CODEC
SDO	O	Serial output signal to CODEC
HSPSCLK	I	Operation clock input of modem interface block for CODEC
TELCON	O	Handset relay control signal
HC0	O	CODEC control signal
HSPMCLK	O	Clock output to CODEC
OPD#	O	Use this pin for controlling power of CODEC and DAA. This signal is set as active when the power supply of CODEC and DAA is ON.

(13) LED interface signal

Signal	I/O	Function
LEDOUT#	O	This is an output signal for lighting LEDs.

**(15) Dedicated V<sub>DD</sub> and GND signals**

Signal Name	Power-Supply System	Function
V <sub>DDP</sub>	2.5 V	Dedicated V <sub>DD</sub> for the PLL analog unit
GNDP	2.5 V	Dedicated GND for the PLL analog unit
V <sub>DDPD</sub>	2.5 V	Dedicated V <sub>DD</sub> for the PLL digital unit. Its function is identical to V <sub>DD2</sub> .
GNDPD	2.5 V	Dedicated GND for the PLL digital unit. Its function is identical to GND2.
CV <sub>DD</sub>	3.3 V	Dedicated V <sub>DD</sub> for the oscillator
CGND	3.3 V	Dedicated GND for the oscillator
DV <sub>DD</sub>	3.3 V	Dedicated V <sub>DD</sub> for the D/A converter. The voltage applied to this pin becomes the maximum of the analog output of AUDIOOUT signal.
DGND	3.3 V	Dedicated GND for D/A converter. The voltage applied to this pin becomes the minimum of the analog output of AUDIOOUT signal.
AV <sub>DD</sub>	3.3 V	Dedicated V <sub>DD</sub> for the A/D converter. The voltage applied to this pin becomes the maximum voltage that can be detected by the A/D interface signals (8 lines).
AGND	3.3 V	Dedicated GND for the A/D converter. The voltage applied to this pin becomes the minimum voltage that can be detected by the A/D interface signals (8 lines).
PIUV <sub>DD</sub>	3.3 V	Dedicated V <sub>DD</sub> for touch-sensitive panel interface
PIUGND	3.3 V	Dedicated GND for touch-sensitive panel interface
V <sub>DD2</sub>	2.5 V	Normal 2.5-V system V <sub>DD</sub>
GND2	2.5 V	Normal 2.5-V system GND
V <sub>DD3</sub>	3.3 V	Normal 3.3-V system V <sub>DD</sub>
GND3	3.3 V	Normal 3.3-V system GND

**Caution** The V<sub>R</sub>4121 has two types of power supplies. There are no restrictions as to the sequence in which these power supplies are applied. However, do not apply one type of power for more than one second while the other power supply is not applied.

**Notes** 1. This differs depending on the setting of the SCLK bit in the SDRAMMODEREG register.

When SCLK bit has a value of "1": outputs clock.

When SCLK bit has a value of "0": low level is output.

2. Maintains the state of the previous Full-speed Mode.

3. When used as the chip select for the ROM or extended ROM, this is the same as ROMCS (0:1)# pins.

When used as the RAS for the extended DRAM, this is the same as MRAS (0:1)# pins.

4. When DBUS32 signal = 1, this becomes the high impedance state.

When DBUS32 signal = 0, the high level is output.

5. When DBUS32 signal = 1: See **Note 7** below.

When DBUS32 signal = 0: high level is output.

6. When DBUS32 signal = 1: low level is output.

When DBUS32 signal = 0: high level is output.

7. Reset by the RSTSW# signal: The pin outputs a low level. (Self refresh)

Reset by the Deadman's switch: The pin outputs a high level.

8. Bus hold from the Suspend Mode: The state of the previous Full-speed Mode is maintained.

Bus hold from Full-speed Mode or Standby Mode: Outputs clocks.

**Remark** 0: low level, 1: high level, Hi-Z: high impedance

- Notes**
1. When initializing, always set BSC bit to 1 in the HSPINT register (0x0C00 0020).
  2. The state of the previous Full-speed Mode is maintained.
  3. Normal operation proceeds.
  4. After the RTC reset is released, this functions as an output port.
  5. Specify the input data level using a high-resistance pull up or pull down resistor.

**Remark** 0: low level, 1: high level, Hi-Z: high impedance

- Notes**
1. Pins DATA (16:31)/GPIO (16:31) in the V<sub>R</sub>4121 function as GPIO (16:31) signals when using the 16-bit data bus. When using these pins as GPIO (16:31) signals, pull them up or pull down so as not to input an intermediate-level signal.
  2. When the bus hold function is used, external pull-up is recommended for the V<sub>R</sub>4121.
  3. Do not input an intermediate-level signal.
  4. When used as the RAS signal of extended DRAM, external pull-up is recommended for the V<sub>R</sub>4121.
  5. When the MPOWER pin outputs the low-level, intermediate-level input is enabled.

- Remarks**
1. No specification (–) in the External Processing column indicates that the external processing is unnecessary.
  2. No specification (–) in the Recommended Connection of Unused Pins column indicates that the pin is always connected.

**Notes 1.** Connect an operation amplifier which has high-impedance input characteristics, since the output level of AUDIOOUT pin varies according to the external impedance.

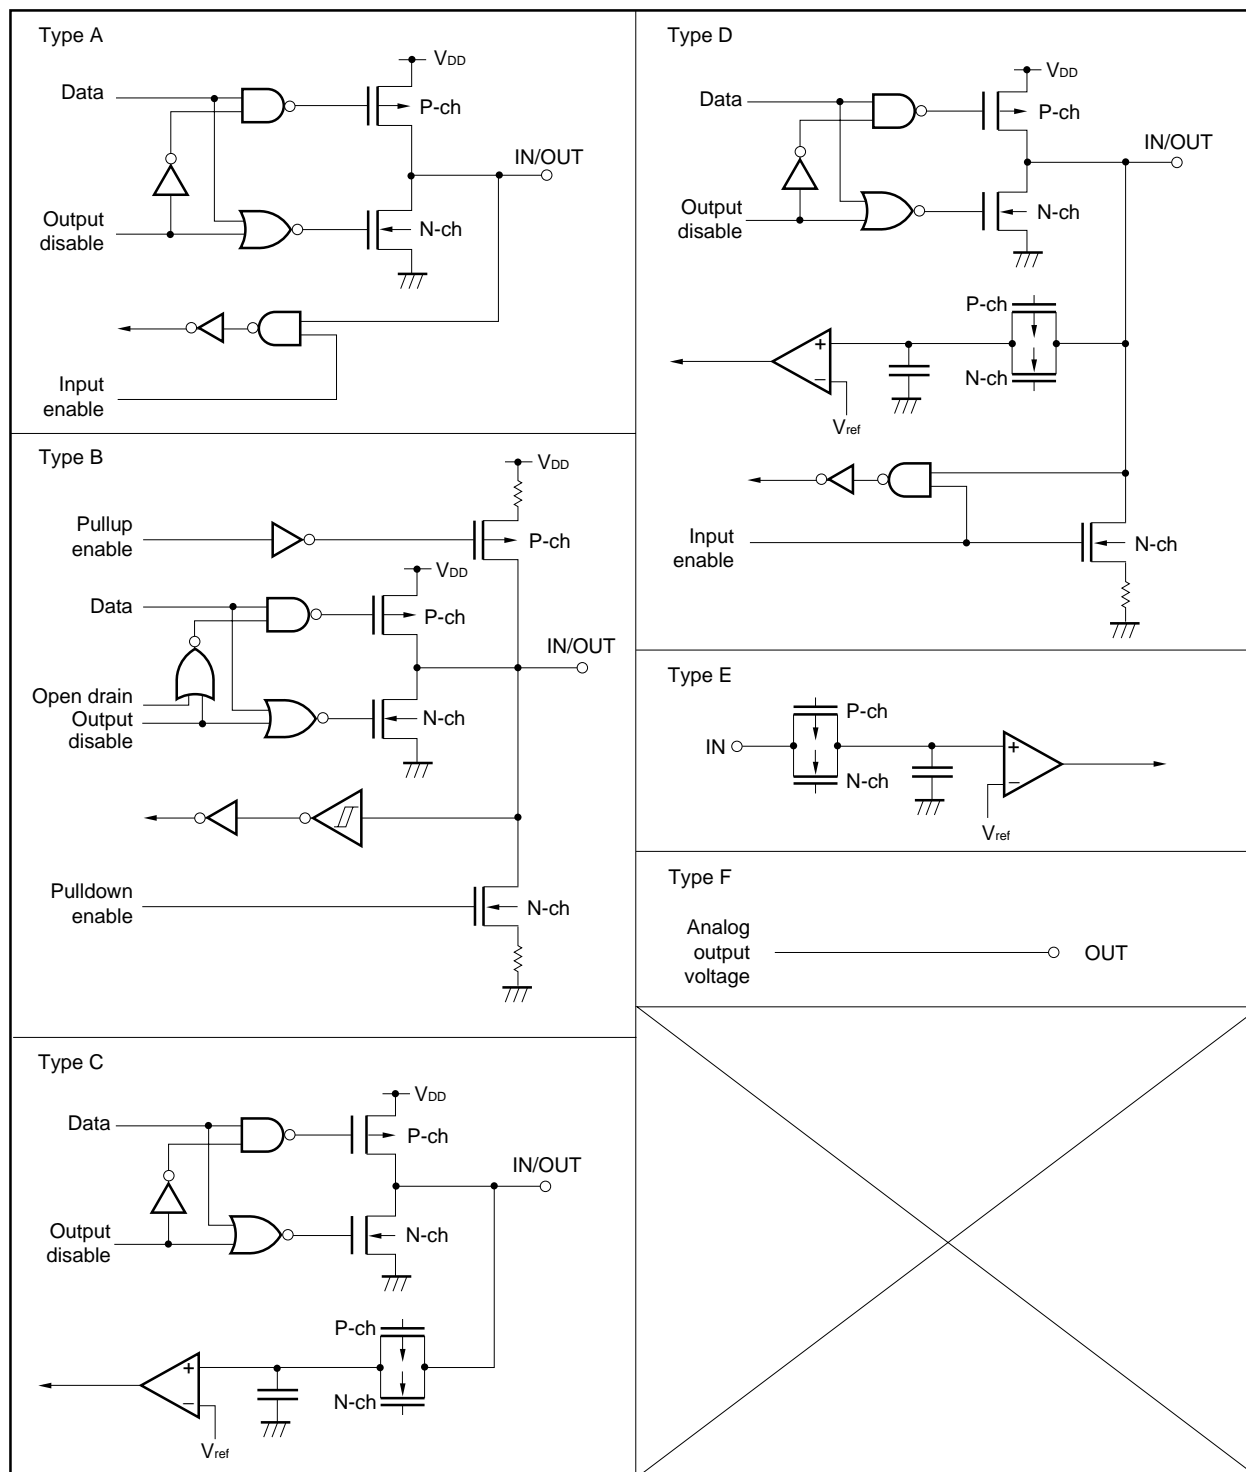

- 2.** If internal pull-up or pull-down resistors are used in GPIO (0:3), SRAS#/GPIO4, SCAS#/GPIO5, SYSDIR/GPIO6, SPOWER/GPIO7, GPIO (8:14) pins switch between pull up, pull down, and open by software.

If an internal pull-up or pull-down resistor is not used, then provide an external pull-up or pull-down resistor.

- 3.** Input a synchronous clock from CODEC.

- Remarks 1.** No specification (–) in the External Processing column indicates that the external processing is unnecessary.
- 2.** No specification (–) in the Recommended Connection of Unused Pins column indicates that the pin is always connected.

## 1.4 Pin I/O Circuits

## 2. ELECTRICAL SPECIFICATIONS

### Absolute Maximum Ratings ( $T_A = 25^\circ\text{C}$ )

Parameter	Symbol	Condition	Rating	Unit
Supply voltage	$V_{DD2}$	2.5 V ( $V_{DDP}$ , $V_{DDPD}$ , $V_{DD2}$ )	-0.5 to +3.3	V
	$V_{DD3}$	3.3 V ( $CV_{DD}$ , $DV_{DD}$ , $AV_{DD}$ , $PIUV_{DD}$ , $V_{DD3}$ )	-0.5 to +4.0	V
Input voltage	$V_I$	$V_{DD3} \geq 3.7$ V	-0.5 to +4.0	V
		$V_{DD3} < 3.7$ V	-0.5 to $V_{DD3} + 0.3$	V
Storage temperature	$T_{stg}$		-65 to +150	$^\circ\text{C}$

**Cautions** 1. Do not short-circuit two or more output pins simultaneously.

2. Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

The specifications and conditions shown in DC Characteristics and AC Characteristics are the ranges for normal operation and quality assurance of the product.

3.  $V_I$  can be -1.5 V if the input pulse is less than 10 ns.

## Operating Conditions

## (1) 131 MHz model

Parameter	Symbol	Condition	MIN.	MAX.	Unit
Supply voltage	V <sub>DD2</sub>	2.5 V (V <sub>DDP</sub> , V <sub>DDPD</sub> , V <sub>DD2</sub> )	2.3	2.7	V
	V <sub>DD3</sub>	3.3 V (CV <sub>DD</sub> , DV <sub>DD</sub> , AV <sub>DD</sub> , PIUV <sub>DD</sub> , V <sub>DD3</sub> )	3.0	3.45	V
Ambient temperature	T <sub>A</sub>		-10	+70	°C
Oscillation start voltage <sup>Note 1</sup>	V <sub>DDS</sub>			3.0	V
Oscillation hold voltage <sup>Note 2</sup>	V <sub>DDH1</sub>			2.5	V
Oscillation hold voltage <sup>Note 3</sup>	V <sub>DDH2</sub>			3.0	V

**Notes 1.** This is a voltage at which oscillation is always started after power application, and is applied to oscillators of 32.768 kHz and 18.432 MHz.

**2.** This is a voltage at which oscillation can be guaranteed if the voltage is lowered from the normal operation level, and is applied to an oscillator of 32.768 kHz.

**3.** This is a voltage at which oscillation can be guaranteed if the voltage is lowered from the normal operation level, and is applied to an oscillator of 18.432 MHz.

## (2) 168 MHz model

#### 4. RECOMMENDED SOLDERING CONDITIONS

The μPD30121 should be soldered and mounted under the following recommended conditions.

For details of recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended below, contact your NEC sales representative.

**Table 4-1. Surface Mounting Type Soldering Conditions**

**μPD30121F1-131-GA1: 224-pin plastic FBGA (16 × 16)**

**μPD30121F1-168-GA1: 224-pin plastic FBGA (16 × 16)**

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 230°C, Time: 30 seconds max. (at 210°C or higher), Count: 2 times max., Exposure limit: 3 days <sup>Note</sup> (after that, prebake at 125°C for 10 to 72 hours.)	IR30-103-2
VPS	Package peak temperature: 215°C, Time: 25 to 40 seconds (at 200°C or higher), Count: 2 times max. , Exposure limit: 3 days <sup>Note</sup> (after that, prebake at 125°C for 10 to 72 hours.)	VP15-103-2
Partial heating	Pin temperature: 300°C max., Time: 3 seconds max. (per pin row)	—

**Note** After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

**Caution** Do not use different soldering methods together (except for partial heating).

**NOTES FOR CMOS DEVICES****① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

**② HANDLING OF UNUSED INPUT PINS FOR CMOS**

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

**③ STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

## Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

Exporting this product or equipment that includes this product may require a governmental license from the U.S.A. for some countries because this product utilizes technologies limited by the export control regulations of the U.S.A.

- **The information in this document is current as of June, 2000. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**
- No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
- NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
- NEC semiconductor products are classified into the following three quality grades:  
 "Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.  
 "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots  
 "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)  
 "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.

(Note)

- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
