

4 BIT SINGLE-CHIP MICROCONTROLLER

The μ PD750108 is one of the 75XL series 4-bit single-chip microcontrollers, which provide data processing capability equal to that of an 8-bit microcontroller.

The μ PD750108 is produced by replacing the main system clock oscillator of the μ PD750008 with an RC oscillator, enabling operation at a relatively low voltage of 1.8 V. In addition, it is best suited to applications using batteries. The μ PD750108(A) has a higher reliability than the μ PD750108.

A built-in one-time PROM product, μ PD75P0116, is also available. It is suitable for small-scale production and evaluation of application systems.

The following user's manual describes the details of the functions of the μ PD750108. Be sure to read it before designing application systems.

μ PD750108 User's Manual: U11330E

FEATURES

- Built-in RC oscillator
- Enables the immediate start of processing after the release of standby mode
- Capable of low-voltage operation: $V_{DD} = 1.8$ to 5.5 V
- Internal memory
 - Program memory (ROM)
 - : $4,096 \times 8$ bits (μ PD750104 and μ PD750104(A))
 - : $6,144 \times 8$ bits (μ PD750106 and μ PD750106(A))
 - : $8,192 \times 8$ bits (μ PD750108 and μ PD750108(A))
 - Data memory (RAM)
 - : 512×4 bits
- Function for specifying the instruction execution time (useful for saving power)
 - $4 \mu s$, $8 \mu s$, $16 \mu s$, $64 \mu s$ (when operating at 1.0 MHz)
 - $2 \mu s$, $4 \mu s$, $8 \mu s$, $32 \mu s$ (when operating at 2.0 MHz)
 - $122 \mu s$ (when operating at 32.768 kHz)
- Enhanced timer function (4 channels)
- Can be easily substituted for the μ PD750008 because this product succeeds to the functions and instructions of the μ PD750008.

APPLICATIONS

- μ PD750104, μ PD750106, and μ PD750108
Cameras, meters, and pagers
- μ PD750104(A), μ PD750106(A), and μ PD750108(A)
Electrical equipment for automobiles

The μ PD750104, μ PD750106, μ PD750108, μ PD750104(A), μ PD750106(A), and μ PD750108(A) differ only in quality grade. In this manual, the μ PD750108 is described unless otherwise specified. Users of other than the μ PD750108 should read μ PD750108 as referring to the pertinent product.

When the description differs among μ PD750104, μ PD750106, and μ PD750108, they also refer to the pertinent (A) products.

μ PD750104 \rightarrow μ PD750104(A), μ PD750106 \rightarrow μ PD750106(A), μ PD750108 \rightarrow μ PD750108(A)

The information in this document is subject to change without notice.

Note The ROM capacity depends on the product.

3. PIN FUNCTIONS

3.1 Port Pins

Pin name	Input/ output	Shared pin	Function	8-bit I/O	When reset	I/O circuit type ^{Note 1}
P00	Input	INT4	4-bit input port (PORT0).	×	Input	(B)
P01	I/O	SCK	For P01 - P03, built-in pull-up resistors can be connected by software in units of 3 bits.			(F)-A
P02	I/O	SO/SB0				(F)-B
P03	I/O	SI/SB1				(M)-C
P10	Input	INT0	4-bit input port (PORT1).	×	Input	(B)-C
P11		INT1	Built-in pull-up resistors can be connected by software in units of 4 bits.			
P12		INT2	A noise eliminator can be selected only when the P10/INT0 pin is used.			
P13		TI0				
P20	I/O	PTO0	4-bit I/O port (PORT2).	×	Input	E-B
P21		PTO1	Built-in pull-up resistors can be connected by software in units of 4 bits.			
P22		PCL				
P23		BUZ				
P30 - P33	I/O	-	Programmable 4-bit I/O port (PORT3). I/O can be specified bit by bit. Built-in pull-up resistors can be connected by software in units of 4 bits.	×	Input	E-B
P40 - P43 ^{Note 2}	I/O	-	N-ch open-drain 4-bit I/O port (PORT4). A pull-up resistor can be provided bit by bit (mask option). Withstand voltage is 13 V in open-drain mode.	○	High level (when pull-up resistors are provided) or high impedance	M-D
P50 - P53 ^{Note 2}	I/O	-	N-ch open-drain 4-bit I/O port (PORT5). A pull-up resistor can be provided bit by bit (mask option). Withstand voltage is 13 V in open-drain mode.		High level (when pull-up resistors are provided) or high impedance	M-D
P60	I/O	KR0	Programmable 4-bit I/O port (PORT6). I/O can be specified bit by bit. Built-in pull-up resistors can be connected by software in units of 4 bits.	○	Input	(F)-A
P61		KR1				
P62		KR2				
P63		KR3				
P70	I/O	KR4	4-bit I/O port (PORT7).		Input	(F)-A
P71		KR5	Built-in pull-up resistors can be connected by software in units of 4 bits.			
P72		KR6				
P73		KR7				
P80	I/O	-	2-bit I/O port (PORT8).	×	Input	E-B
P81		-	Built-in pull-up resistors can be connected by software in units of 2 bits.			

Notes 1. The circle (○) indicates the Schmitt trigger input.

2. When pull-up resistors that can be specified with the mask option are not incorporated (when pins are used as N-ch open-drain input ports), the input leak low current increases when an input instruction or bit operation instruction is executed.

3.2 Non-Port Pins

Pin name	Input/ output	Shared pin	Function		When reset	I/O circuit typeNote 1
TI0	Input	P13	Inputs external event pulse to the timer/event counter		Input	(B)-C
PTO0	Output	P20	Timer/event counter output		Input	E-B
PTO1		P21	Timer counter output			
PCL		P22	Clock output			
BUZ		P23	Arbitrary frequency output (for buzzer output or system clock trimming)			
$\overline{\text{SCK}}$	I/O	P01	Serial clock I/O		Input	(F) -A
SO/SB0		P02	Serial data output Serial data bus I/O			(F) -B
SI/SB1		P03	Serial data input Serial data bus I/O			(M)-C
INT4	Input	P00	Edge detection vectored interrupt input (both rising and falling edges are detected)			(B)
INT0	Input	P10	Edge detection vectored interrupt input (detection edge selectable). A noise eliminator can be selected when INT0/P10 is used.	Note 2	Input	(B)-C
INT1		P11		Note 3		
INT2	Input	P12	Rising edge detection testable input	Note 3		
KR0 - KR3	Input	P60 - P63	Falling edge detection testable input		Input	(F) -A
KR4 - KR7	Input	P70 - P73	Falling edge detection testable input		Input	(F) -A
CL1	-	-	Pin for connecting a resistor (R) or capacitor (C) for main system clock oscillation. An external clock cannot be input.		-	-
CL2	-					
XT1	Input	-	Crystal connection pin for subsystem clock generation. When external clock signal is used, it is applied to XT1, and it reverse phase signal is applied to XT2. XT1 can be used as a 1-bit input (test).		-	-
XT2	-					
$\overline{\text{RESET}}$	Input	-	System reset input (active low)		-	(B)
IC	-	-	Internally connected. (To be connected directly to V _{DD})		-	-
V _{DD}	-	-	Positive power supply		-	-
V _{SS}	-	-	Ground potential		-	-

Notes 1. The circle (○) indicates the Schmitt trigger input.

2. With a noise eliminator/asynchronously selectable

3. Asynchronous

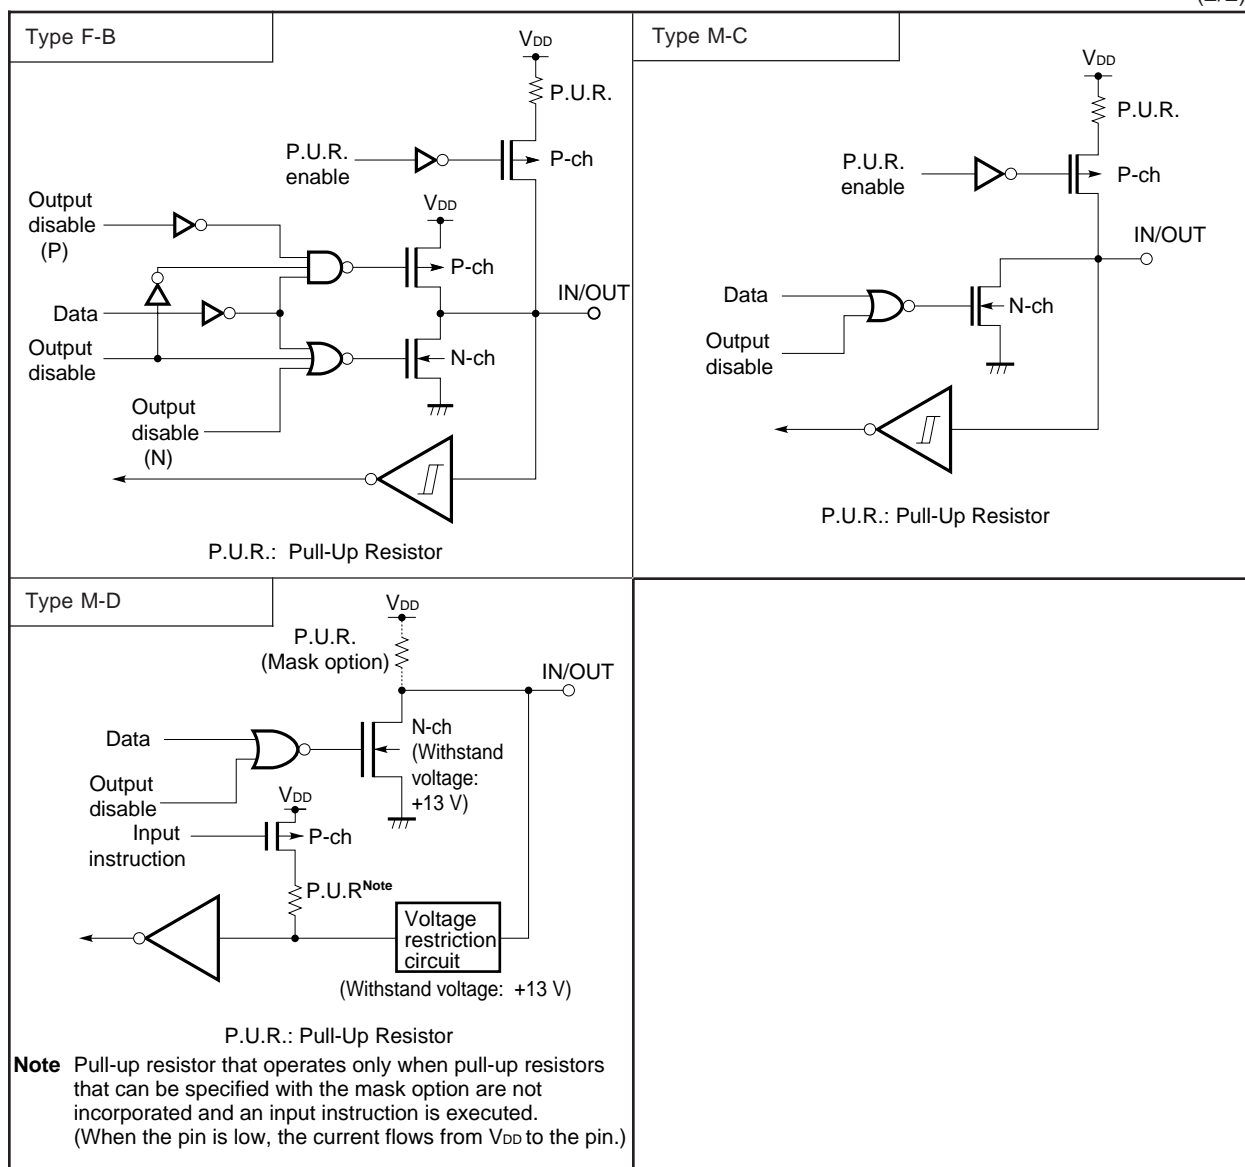

3.3 Pin Input/Output Circuits

The input/output circuit of each μ PD750108 pin is shown below in a simplified manner.

(1/2)

(2/2)

3.4 Connection of Unused Pins

Table 3-1. Connection of Unused Pins

Pin name	Recommended connection
P00/INT4	To be connected to V _{SS} or V _{DD}
P01/ $\overline{\text{SCK}}$	To be connected to V _{SS} or V _{DD} through a separate resistor
P02/SO/SB0	
P03/SI/SB1	To be connected to V _{SS}
P10/INT0 - P12/INT2	To be connected to V _{SS} or V _{DD}
P13/TI0	
P20/PTO0	Input state : To be connected to V _{SS} or V _{DD} through a separate resistor Output state : To be left open
P21/PTO1	
P22/PCL	
P23/BUZ	
P30 - P33	
P40 - P43	Input state : To be connected to V _{SS} Output state : To be connected to V _{SS} (Do not connect to a pull-up resistor specified with a mask option.)
P50 - P53	
P60/KR0 - P63/KR3	Input state : To be connected to V _{SS} or V _{DD} through a separate resistor Output state : To be left open
P70/KR4 - P73/KR7	
P80, P81	
XT1 ^{Note}	To be connected to V _{SS} or V _{DD}
XT2 ^{Note}	To be left open
IC	To be connected directly to V _{DD}

Note When the subsystem clock is not used, set SOS.0 to 1 (not to use the built-in feedback resistor).

4. Mk I MODE/Mk II MODE SWITCH FUNCTION

4.1 Differences between Mk I Mode and Mk II Mode

The CPU of the μPD750108 has two modes (Mk I mode and Mk II mode) and which mode is used is selectable. Bit 3 of the stack bank selection register (SBS) determines the mode.

- Mk I mode: This mode has the upward compatibility with the 75X series.
It can be used in the 75XL CPUs having a ROM of up to 16 KB.
- Mk II mode: This mode is not compatible with the 75X series.
It can be used in all 75XL CPUs, including those having a ROM of 16 KB or more.

Table 4-1 shows the differences between Mk I mode and Mk II mode.

Table 4-1. Differences between Mk I Mode and Mk II Mode

	Mk I mode	Mk II mode
Number of stack bytes in a subroutine instruction	2 bytes	3 bytes
BRA !addr1 instruction CALLA !addr1 instruction	None	Available
CALL !addr instruction	3 machine cycles	4 machine cycles
CALLF !faddr instruction	2 machine cycles	3 machine cycles

Caution Mk II mode can be used to support a program area larger than 16K bytes in the 75X series or 75XL series. This mode enhances a software compatibility with products whose program area is larger than 16K bytes. If Mk II mode is selected, when the subroutine call instruction is executed, the number of stack bytes (use area) will be increased by one byte for each stack, compared to Mk I mode. When a CALL !addr or CALLF !faddr instruction is executed, it takes one more machine cycle. Therefore, Mk I mode should be used for applications for which RAM efficiency or processing capabilities is more critical than a software compatibility.

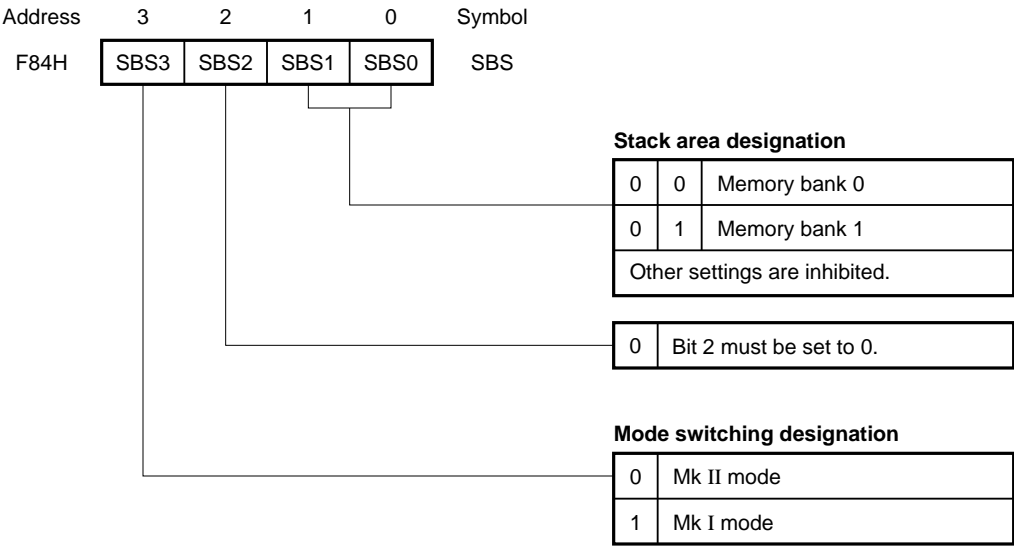

4.2 Setting of the Stack Bank Selection Register (SBS)

The Mk I mode and Mk II mode are switched by stack bank selection register. Figure 4-1 shows the register configuration.

The stack bank selection register is set with a 4-bit memory operation instruction. To use the CPU in Mk I mode, initialize the register to 100×B^{Note} at the beginning of the program. To use the CPU in Mk II mode, initialize it to 000×B^{Note}.

Note Specify the desired value in ×.

Figure 4-1. Stack Bank Selection Register Format

Caution The CPU operates in Mk I mode after the RESET signal is issued, because bit 3 of SBS is set to 1. Set bit 3 of SBS to 0 (Mk II mode) to use the CPU in Mk II mode.

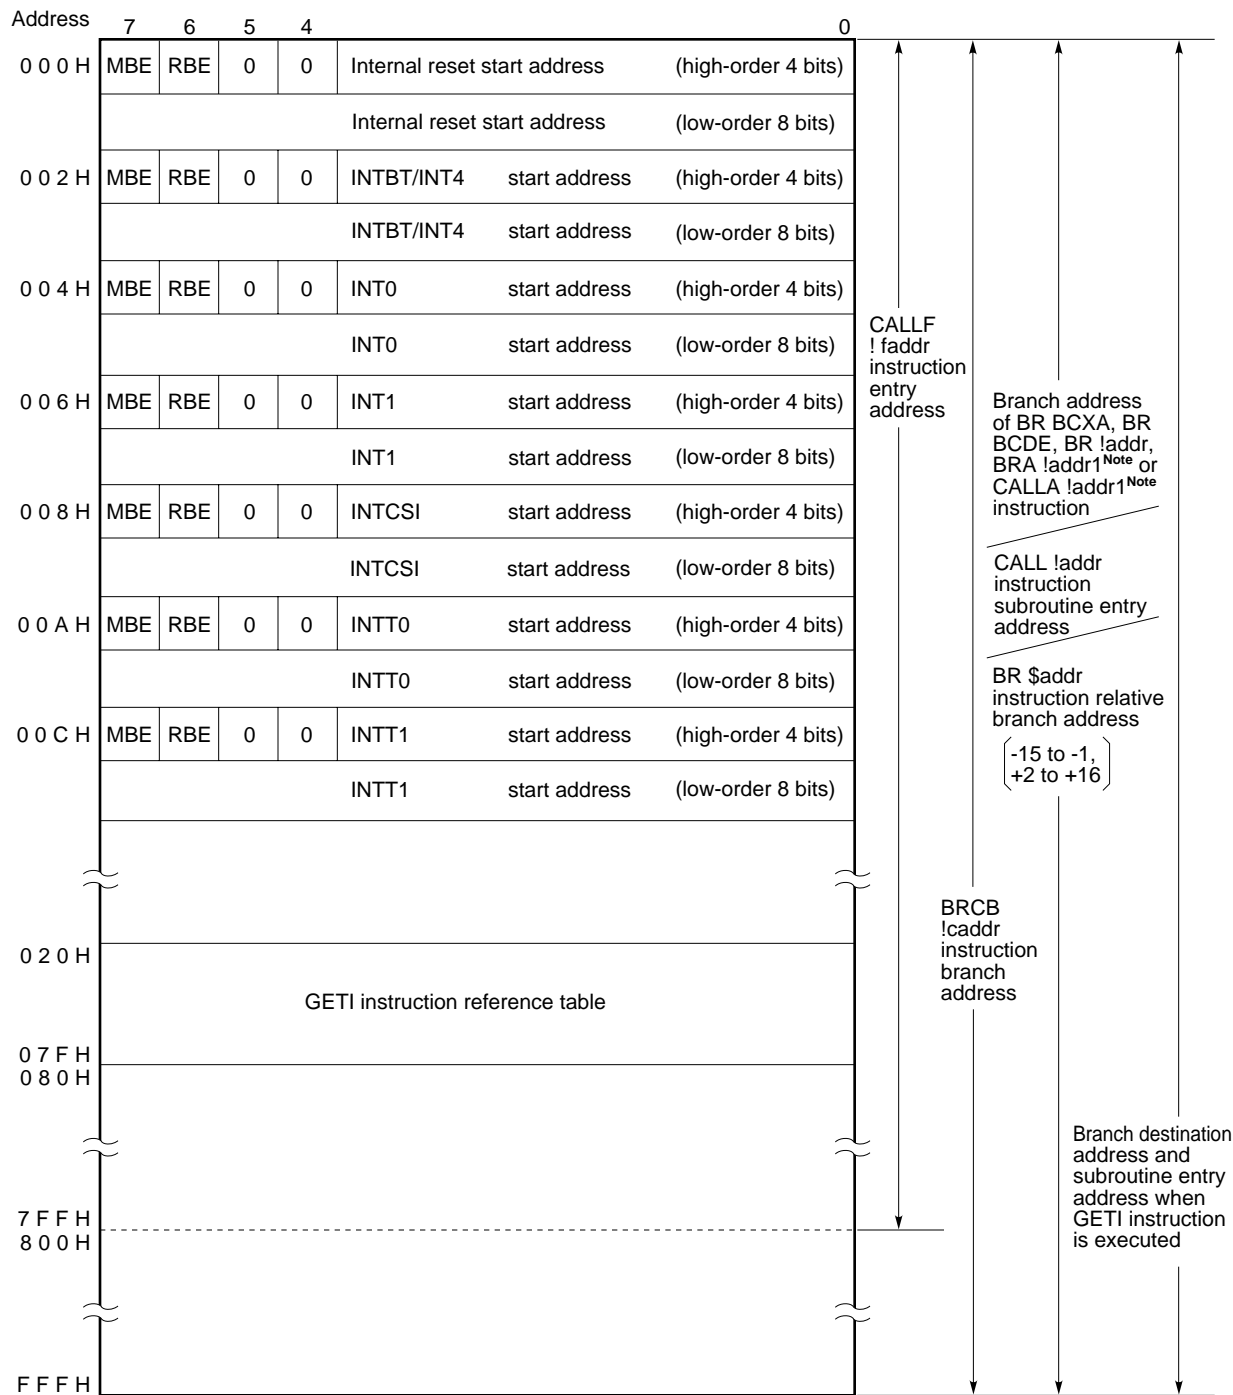

5. MEMORY CONFIGURATION

- **Program memory (ROM) :** $4,096 \times 8$ bits (0000H-0FFFH): μ PD750104
 $6,144 \times 8$ bits (0000H-17FFH): μ PD750106
 $8,192 \times 8$ bits (0000H-1FFFH): μ PD750108
- 0000H to 0001H
Vector address table for holding the RBE and MBE values and program start address when a $\overline{\text{RESET}}$ signal is issued (allowing a reset start at an arbitrary address)
- 0002H to 000DH
Vector address table for holding the RBE and MBE values and program start address for each vectored interrupt (allowing interrupt processing to be started at an arbitrary address)
- 0020H to 007FH
Table area referenced by the GETI instruction^{Note}

Note The GETI instruction requires only one byte to represent an arbitrary two-byte or three-byte instruction or two one-byte instructions, reducing the number of program bytes.

- **Data memory (RAM)**
 - Data area : 512×4 bits (000H to 1FFH)
 - Peripheral hardware area: 128×4 bits (F80H to FFFH)

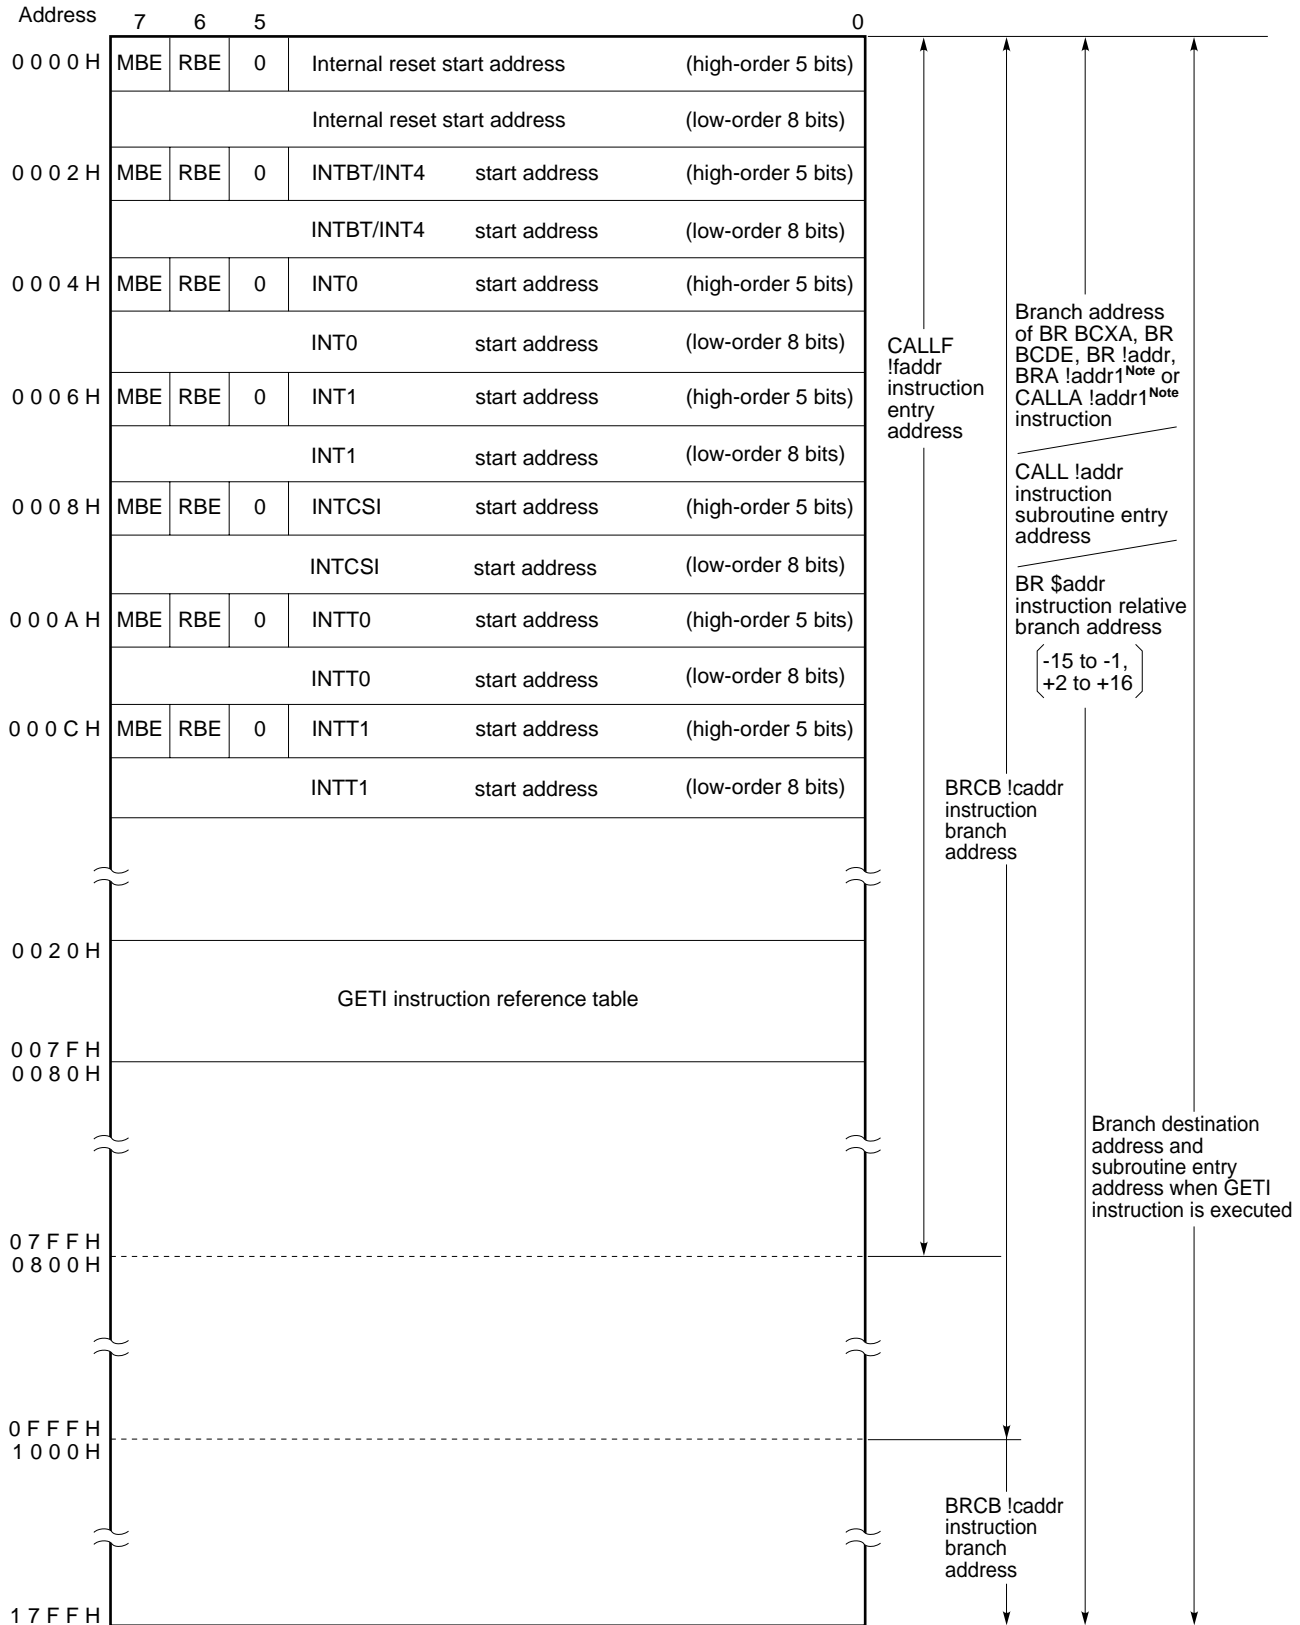

Figure 5-1. Program Memory Map (in μPD750104)

Note Can be used only in the Mk II mode.

Remark In addition to the above, the BR PCDE and BR PCXA instructions can cause a branch to an address with only the 8 low-order bits of the PC changed.

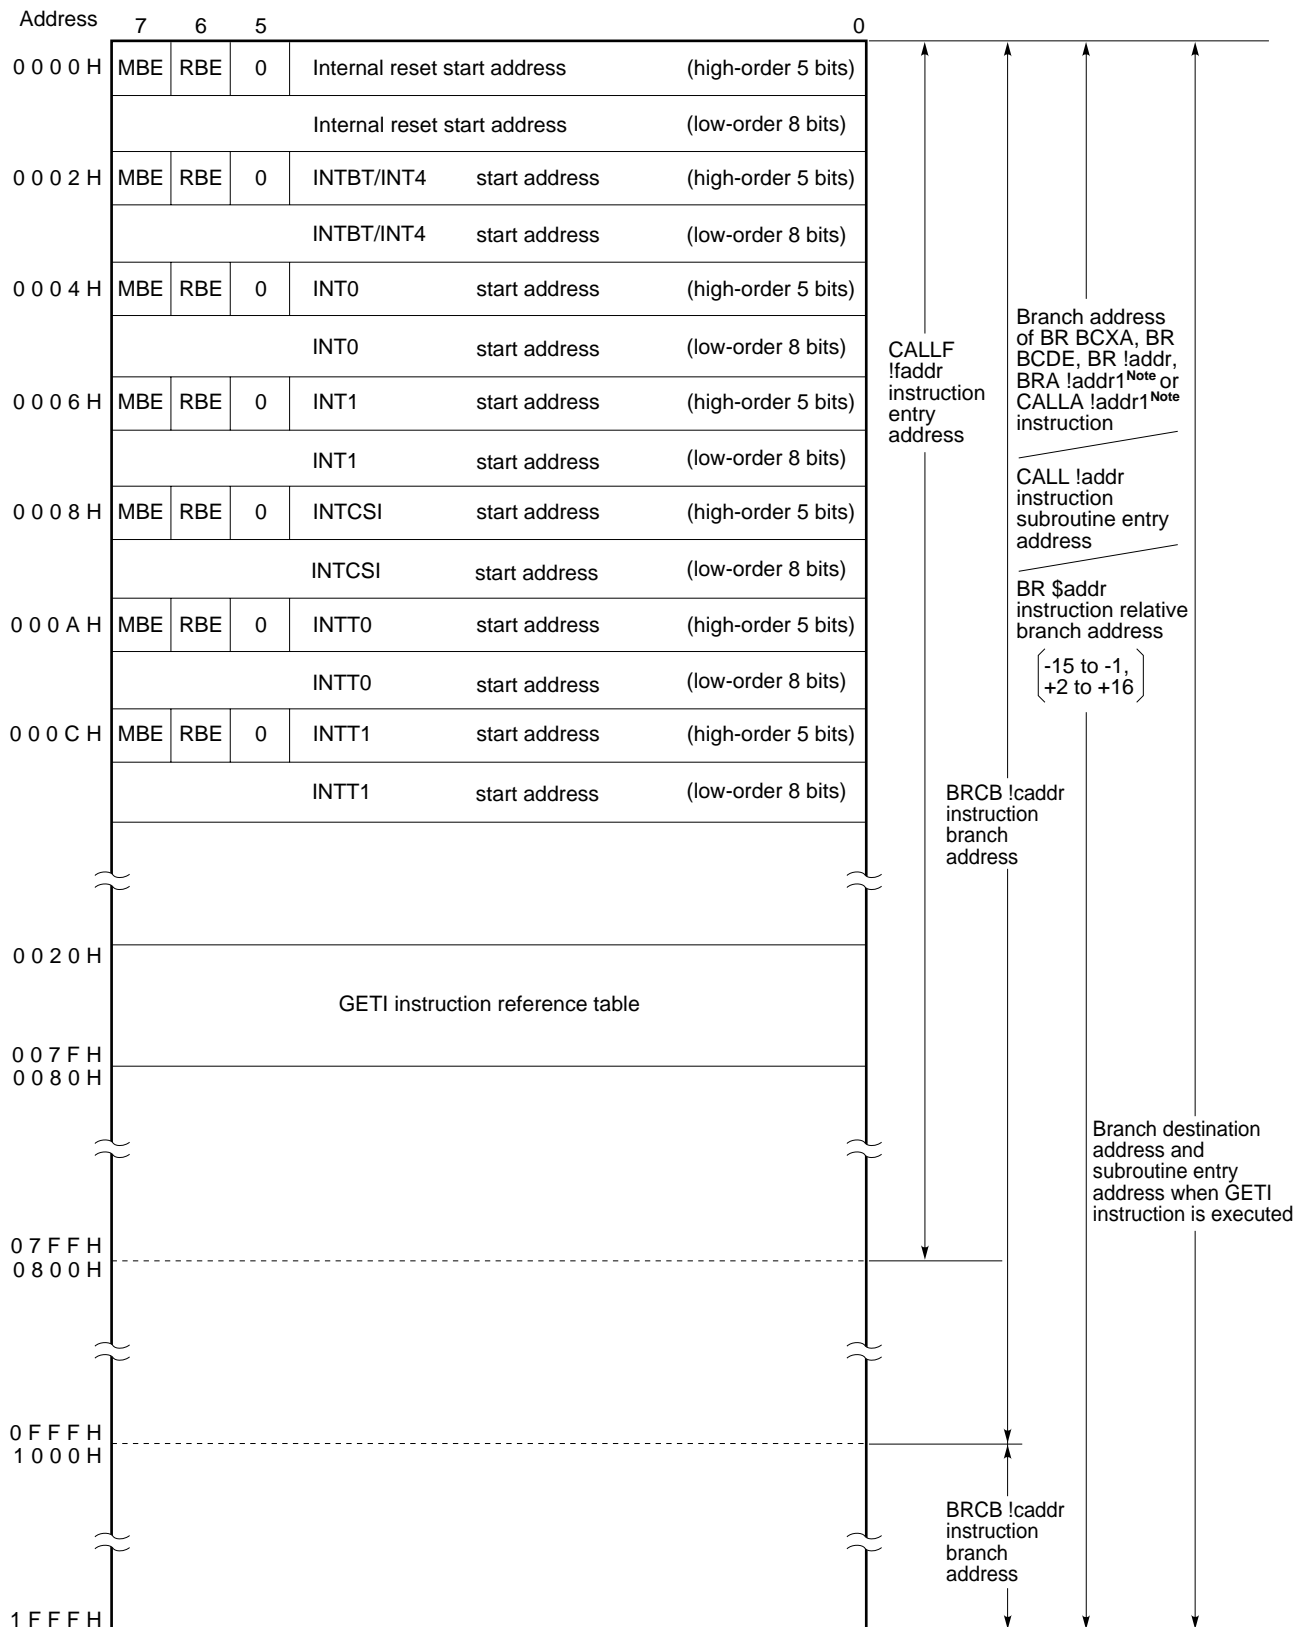

Figure 5-2. Program Memory Map (in μPD750106)

Note Can be used only in the Mk II mode.

Remark In addition to the above, the BR PCDE and BR PCXA instructions can cause a branch to an address with only the 8 low-order bits of the PC changed.

Figure 5-3. Program Memory Map (in μPD750108)

Note Can be used only in the Mk II mode.

Remark In addition to the above, the BR PCDE and BR PCXA instructions can cause a branch to an address with only the 8 low-order bits of the PC changed.

Figure 5-4. Data Memory Map

Note Memory bank 0 or 1 can be selected as the stack area.

6. PERIPHERAL HARDWARE FUNCTIONS

6.1 Digital I/O Ports

The μPD750108 has the following three types of I/O port:

- 8 CMOS input pins (PORT0 and PORT1)
- 18 CMOS I/O pins (PORT2, PORT3, and PORT6 to PORT8)
- 8 N-ch open-drain I/O pins (PORT4 and PORT5)

Total: 34 pins

Table 6-1. Digital Ports and Their Features

Port name	Function	Operation and feature		Remarks
PORT0	4-bit input	When the serial interface function is used, dual-function pins function as output pins in some operation modes.		Also used as INT4, $\overline{\text{SCK}}$, SO/SB0, or SI/SB1.
PORT1		4-bit input port		Also used as INT0, INT1, INT2 or TI0.
PORT2	4-bit I/O	Allows input or output mode setting in units of 4 bits.		Also used as PTO0, PTO1, PCL, or BUZ.
PORT3		Allows input or output mode setting in units of 1 bit.		-
PORT4	4-bit I/O (N-ch open-drain can withstand 13 V)	Allows input or output mode setting in units of 4 bits. Whether to use pull-up resistors can be specified bit by bit with the mask option.	Ports 4 and 5 can be paired, allowing data I/O in units of 8 bits.	
PORT5				
PORT6	4-bit I/O	Allows input or output mode setting in units of 1 bit.	Ports 6 and 7 can be paired, allowing data I/O in units of 8 bits.	Also used as one of KR0 to KR3.
PORT7		Allows input or output mode setting in units of 4 bits.		Also used as one of KR4 to KR7.
PORT8	2-bit I/O	Allows input or output mode setting in units of 2 bits.		-

6.2 Clock Generator

The clock generator generates clocks which are supplied to the peripheral hardware in the CPU. Figure 6-1 shows the configuration of the clock generator.

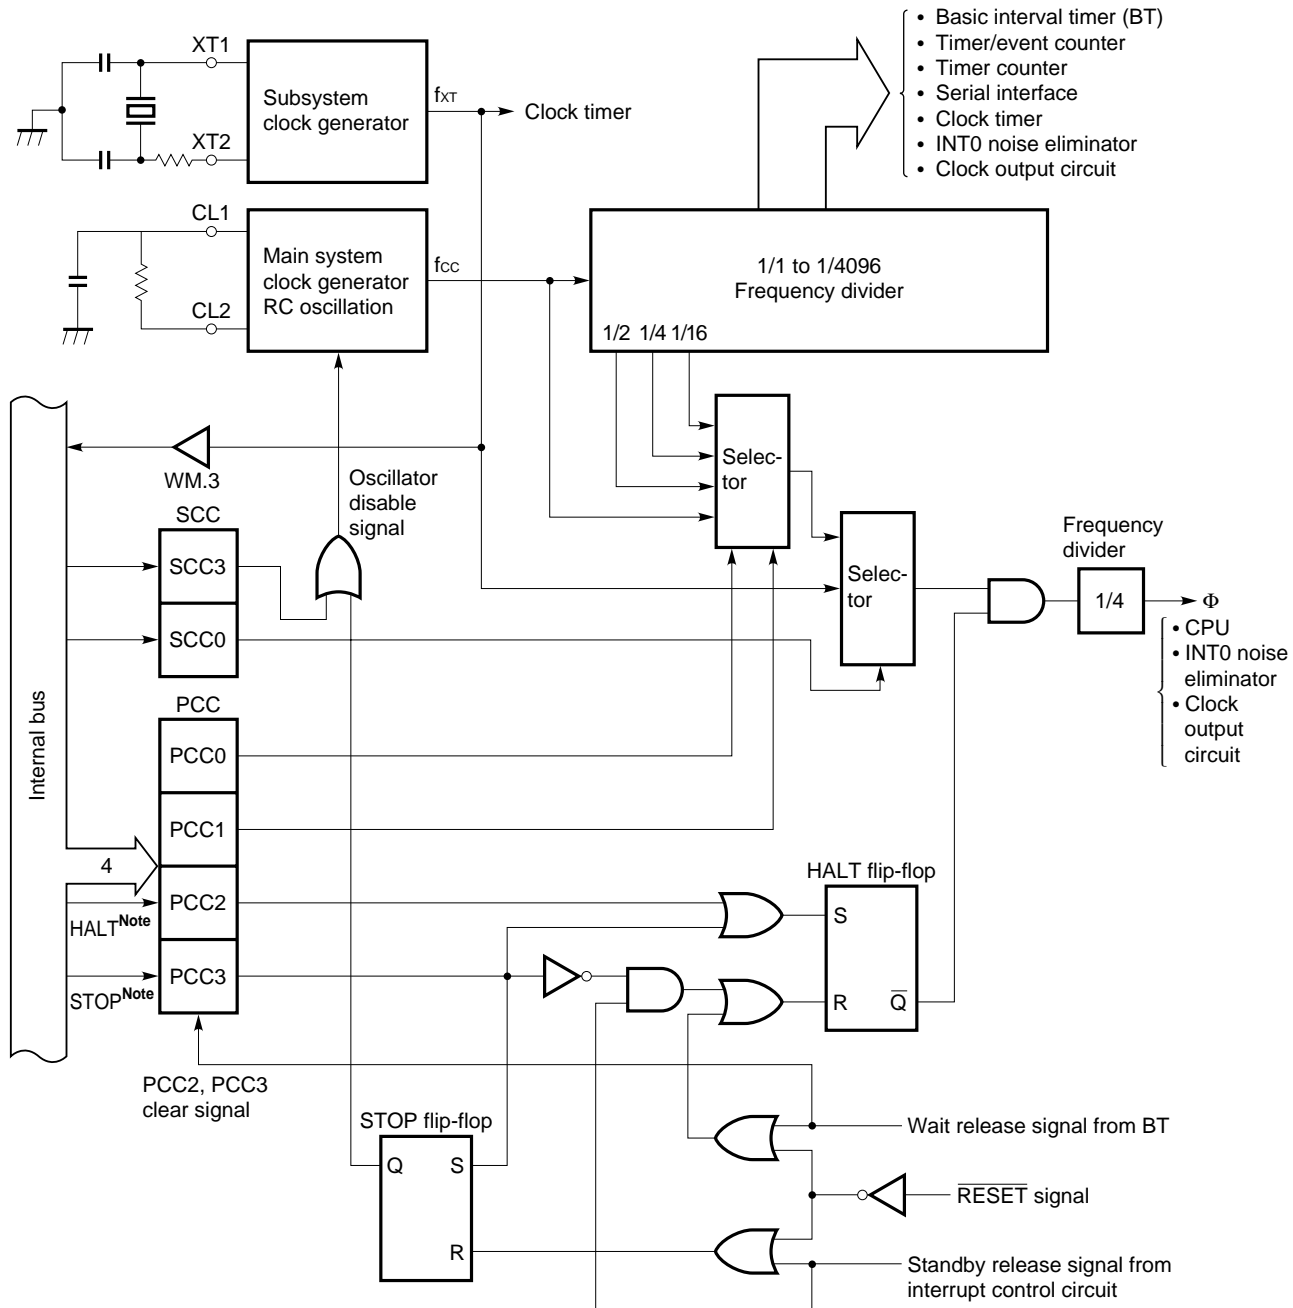

Operation of the clock generator is specified by the processor clock control register (PCC) and system clock control register (SCC).

The main system clock and subsystem clock are used.

The instruction execution time can be made variable.

- 4, 8, 16, or 64 μs (when the main system clock is at 1.0 MHz)
- 2, 4, 8, or 32 μs (when the main system clock is at 2.0 MHz)
- 122 μs (when the subsystem clock is at 32.768 kHz)

Figure 6-1. Clock Generator Block Diagram

Note Instruction execution

- Remarks**
1. f_{cc} = Main system clock frequency
 2. f_{xt} = Subsystem clock frequency
 3. Φ = CPU clock
 4. PCC: Processor clock control register
 5. SCC: System clock control register
 6. One clock cycle (t_{cy}) of the CPU clock (Φ) is equal to one machine cycle of an instruction.

6.3 Control Functions of Subsystem Clock Oscillator

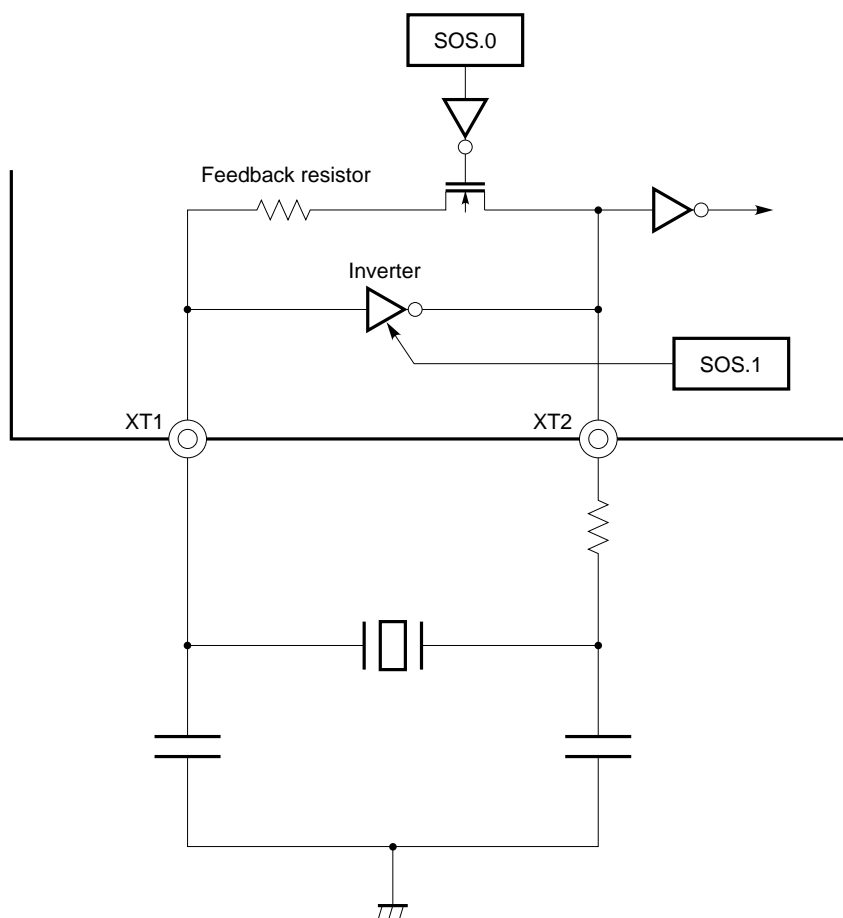

The subsystem clock oscillator of the μ PD750108 has two control functions to decrease the supply current.

- The function to select with the software whether to use the built-in feedback resistor
- The function to suppress the supply current by reducing the drive current of the built-in inverter when the supply voltage is high ($V_{DD} \bullet 2.7 \text{ V}$)

Note When the subsystem clock is not used, set SOS.0 to 1 (not to use the built-in feedback resistor), connect XT1 to V_{SS} or V_{DD}, and open XT2. This makes it possible to reduce the supply current required by the subsystem clock oscillator.

Each function can be used by switching bits 0 and 1 in the sub-oscillator control register (SOS). (See **Figure 6-2**.)

Figure 6-2. Subsystem Clock Oscillator

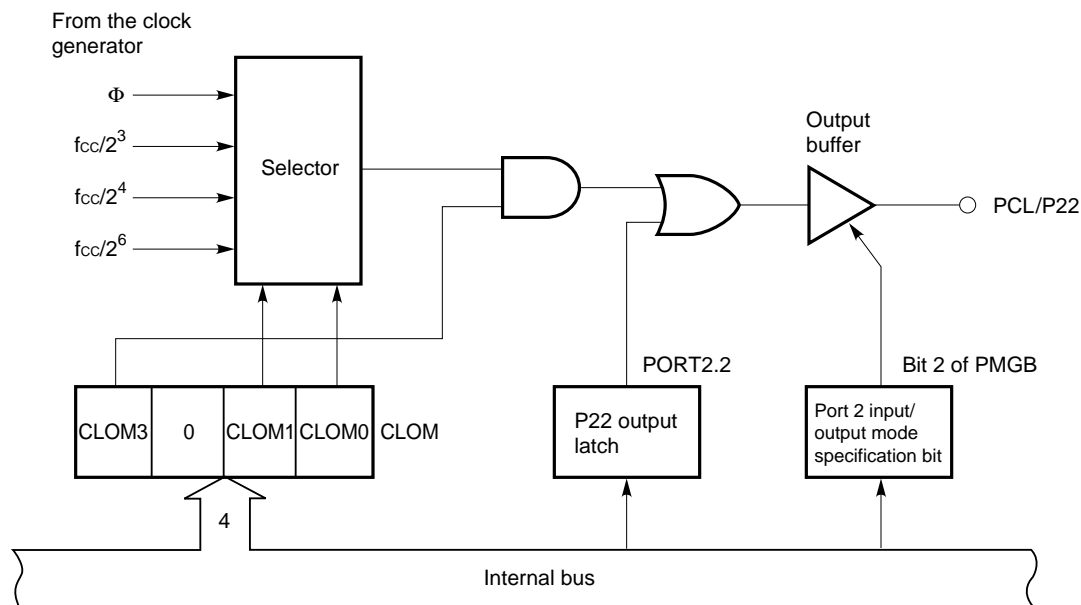

6.4 Clock Output Circuit

The clock output circuit outputs a clock pulse from the P22/PCL pin. This clock pulse is used for remote control waveform output, peripheral LSIs, etc.

- Clock output (PCL): Φ , 125, 62.5, or 15.6 kHz (at 1.0 MHz)
 Φ , 250, 125, or 31.3 kHz (at 2.0 MHz)

Figure 6-3. Clock Output Circuit Configuration

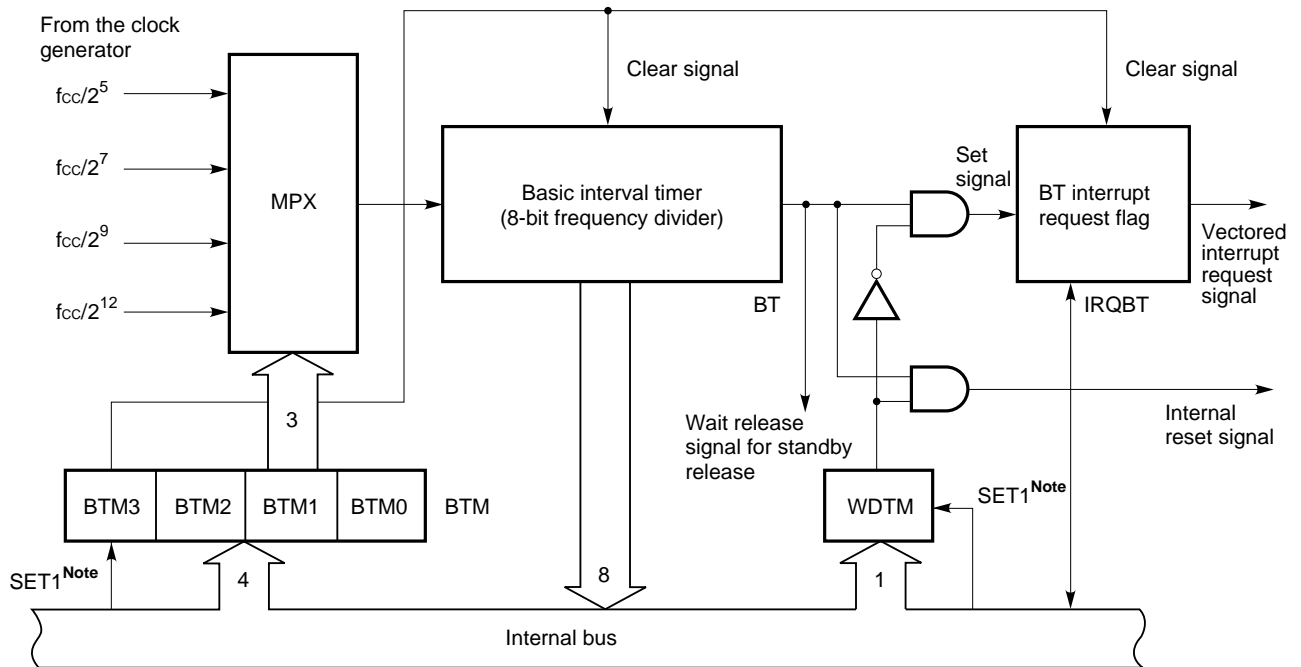

Remark Measures are taken to prevent outputting a narrow pulse when selecting clock output enable/disable.

6.5 Basic Interval Timer/Watchdog Timer

The basic interval timer/watchdog timer has these functions:

- Interval timer operation which generates a reference timer interrupt
- Operation as a watchdog timer for detecting program crashes and resetting the CPU
- Selection of wait time for releasing the standby mode and counting the wait time
- Reading out the count value

Figure 6-4. Block Diagram of the Basic Interval Timer/Watchdog Timer

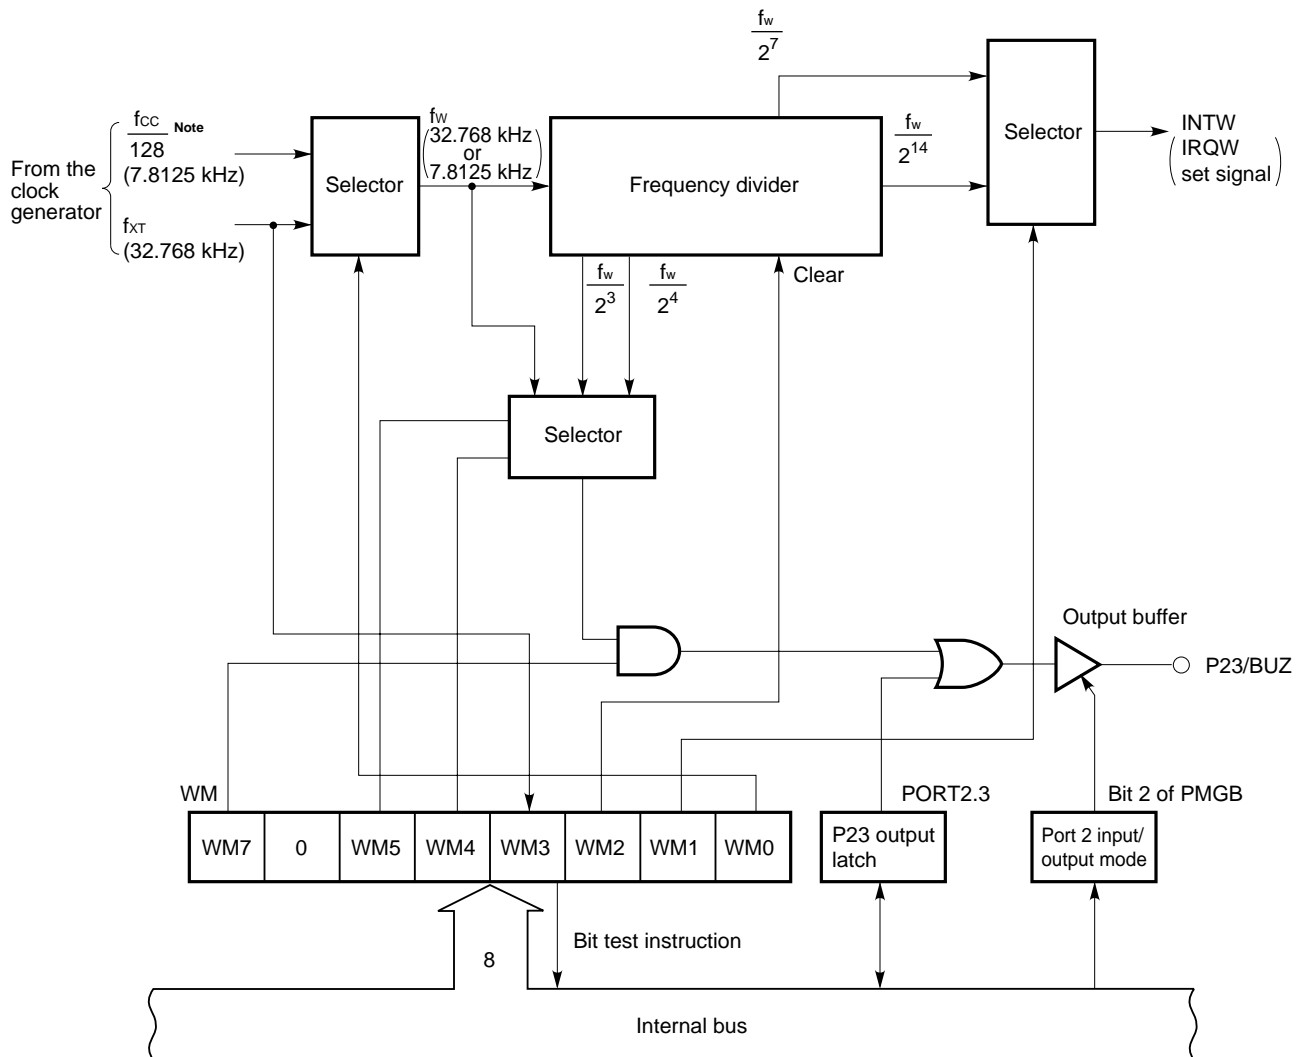

Note Instruction execution

6.6 Clock Timer

The μ PD750108 contains one channel for a clock timer. The clock timer provides the following functions:

- Sets the test flag (IRQW) with a 0.5 sec interval (when WM0 = 1).
- The standby mode can be released by IRQW.
- The 0.5 second interval can be generated from the subsystem clock (32.768 kHz).
- The time interval can be made 128 times faster by selecting the fast mode. This is convenient for program debugging, testing, etc.
- Any of the frequencies ($f_w/2^4$, $f_w/2^3$, or f_w can be output to the P23/BUZ pin. This can be used for beep and system clock frequency trimming.
- The clock can be started from zero seconds by clearing the frequency divider.

Figure 6-5. Clock Timer Block Diagram

Note When a frequency-divided main system clock is used, 32.768 kHz cannot be selected as the source clock frequency.

Remark The values in parentheses in the figure above are for $f_{cc} = 1.0$ MHz, $f_{xt} = 32.768$ kHz.

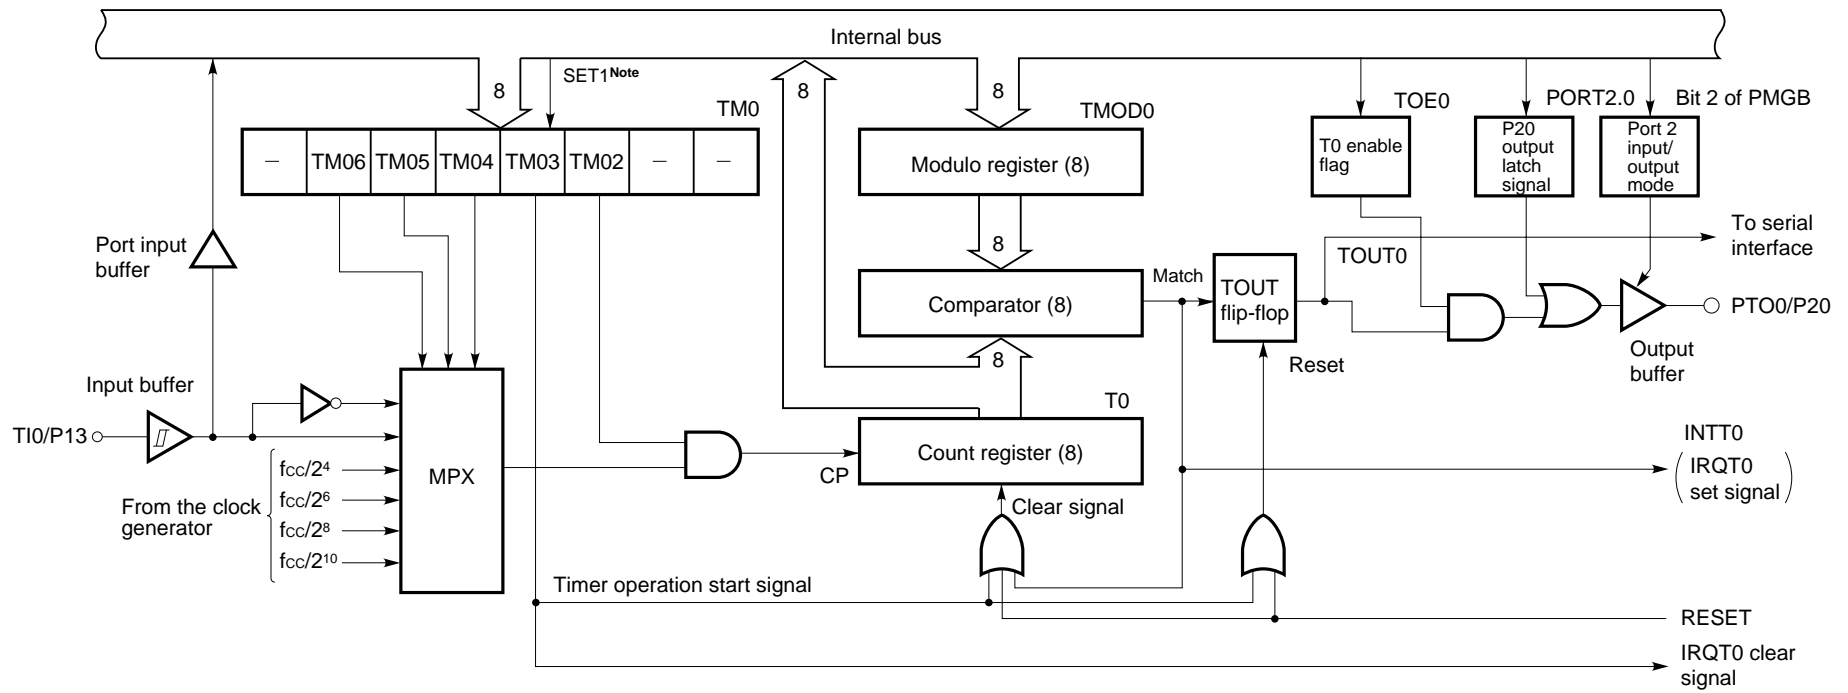

6.7 Timer/Event Counter

The μ PD750108 contains one channel for a timer/event counter and one channel for a timer counter. Figures 6-6 and 6-7 show their configurations.

The timer/event counter provides the following functions:

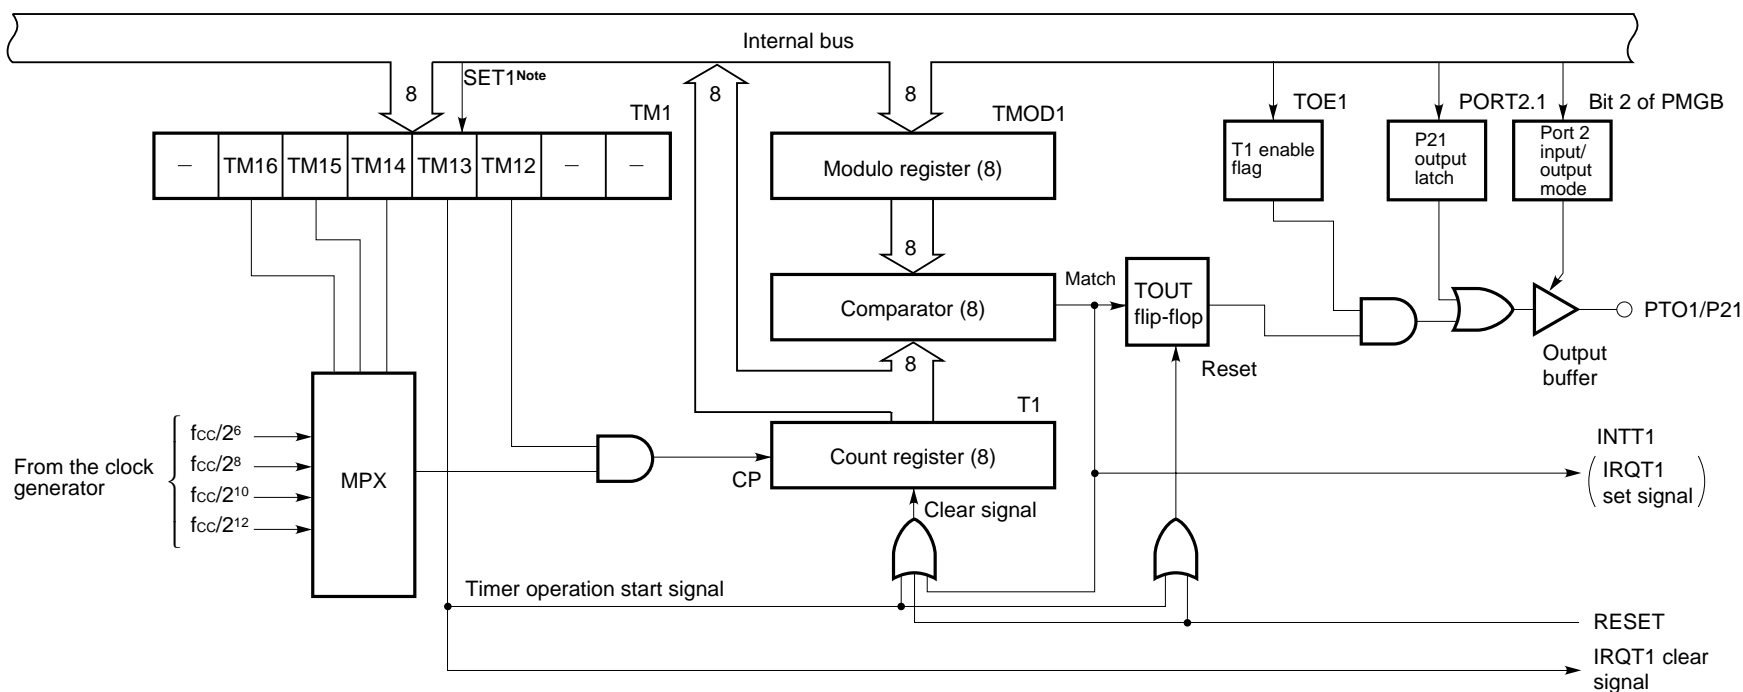

- Programmable interval timer operation
- Outputs square-wave signal of an arbitrary frequency to the PTO_n pin (n = 0, 1)
- Event counter operation (channel 0 only)
- Divides the TI0 pin input by N and outputs to the PTO0 pin (frequency divider operation) (channel 0 only)
- Supplies serial shift clock to the serial interface circuit (channel 0 only)
- Count read function

Figure 6-6. Timer/Event Counter Block Diagram

Note Instruction execution

Figure 6-7. Timer Counter Block Diagram

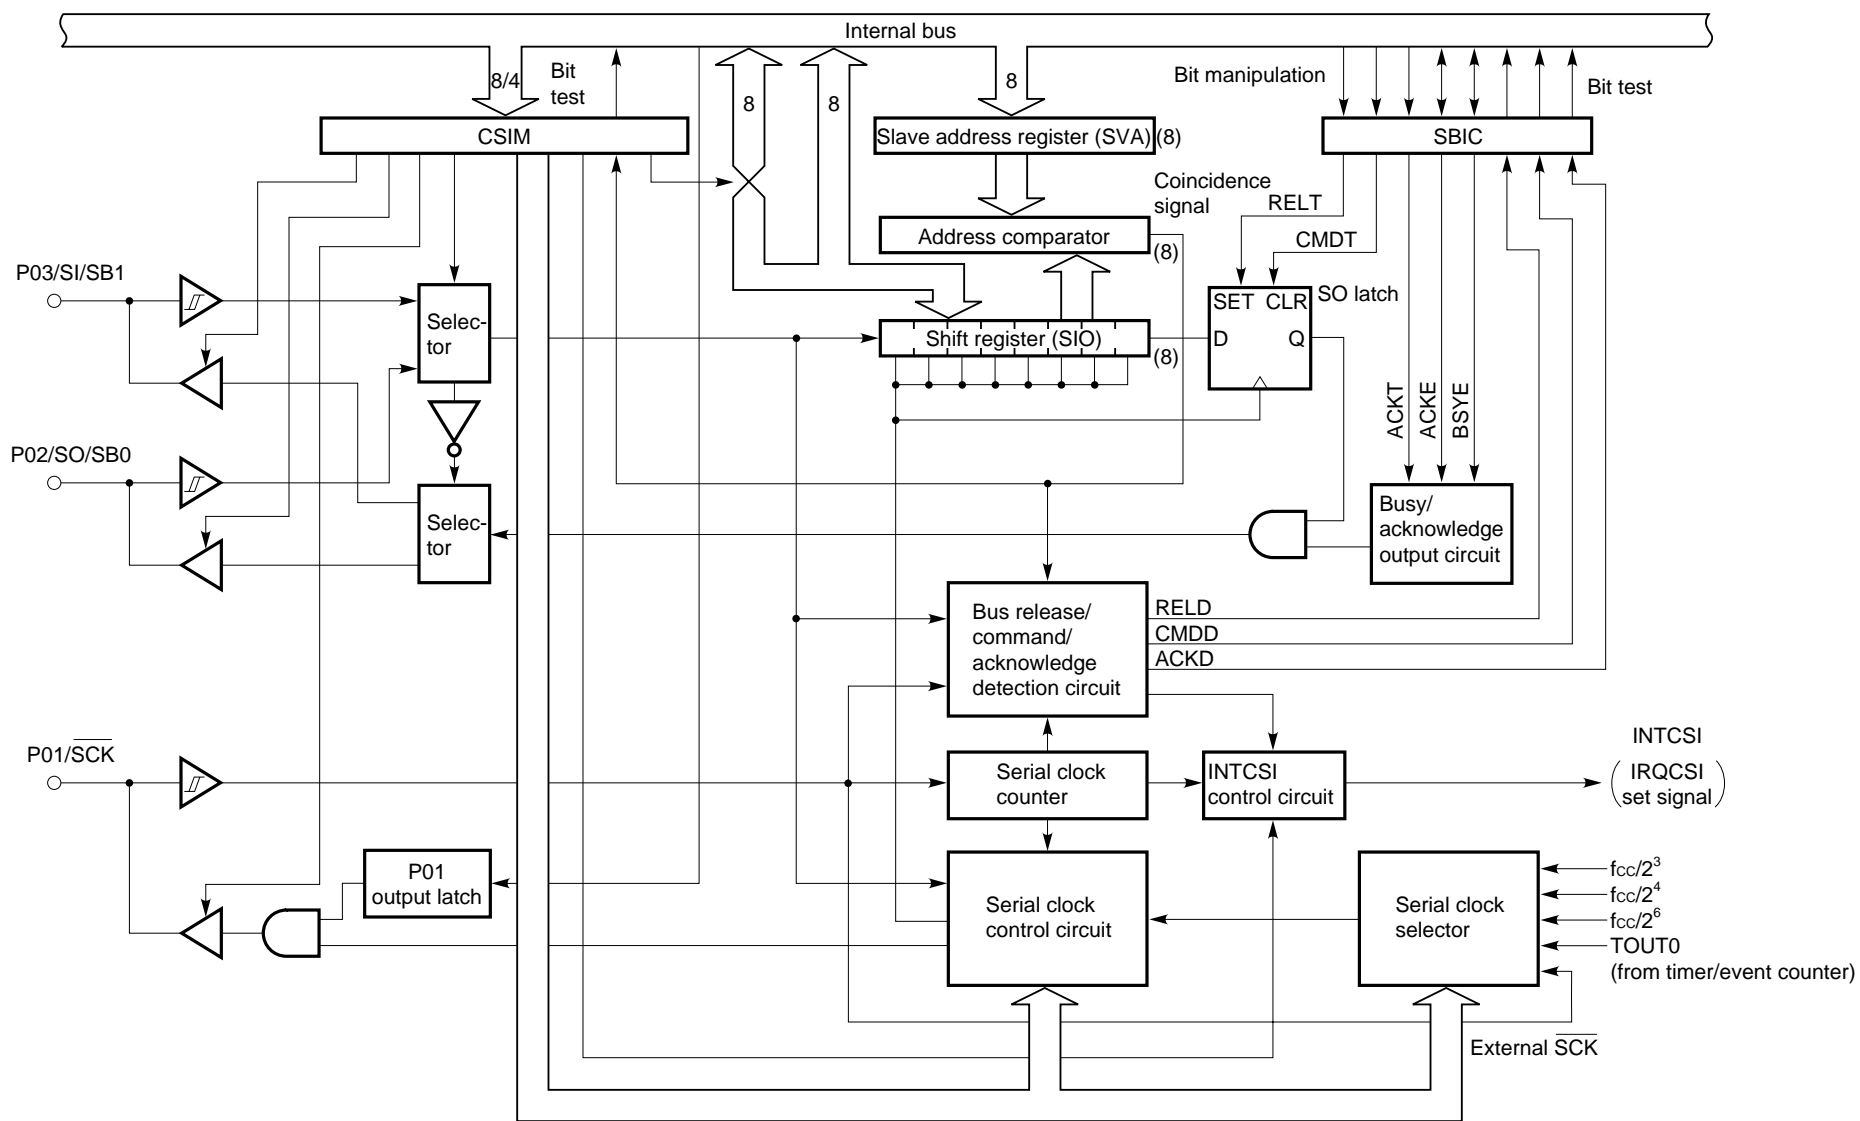

Note Instruction execution

6.8 Serial Interface

μPD750108 has an 8-bit synchronous serial interface. The serial interface has the following four types of mode.

- Operation stop mode
- Three-wire serial I/O mode
- Two-wire serial I/O mode
- SBI mode

Figure 6-8. Serial Interface Block Diagram

6.9 Bit Sequential Buffer: 16 Bits

The bit sequential buffer (BSB) is a data memory specifically provided for bit manipulation. With this buffer, addresses and bit specifications can be sequentially updated by bit manipulation operation. Therefore, this buffer is very useful for processing long data in bit units.

Figure 6-9. Bit Sequential Buffer Format

Remarks 1. In pmem.@L addressing, bit specification is shifted according to the L register.

2. In pmem.@L addressing, the bit sequential buffer can be manipulated at any time regardless of MBE/MBS specification.

7. INTERRUPT FUNCTIONS AND TEST FUNCTIONS

The μ PD750108 has seven interrupt sources and two test sources. One test source, INT2, has two types of edge detection testable input pins.

The interrupt control circuit of the μ PD750108 has the following functions.

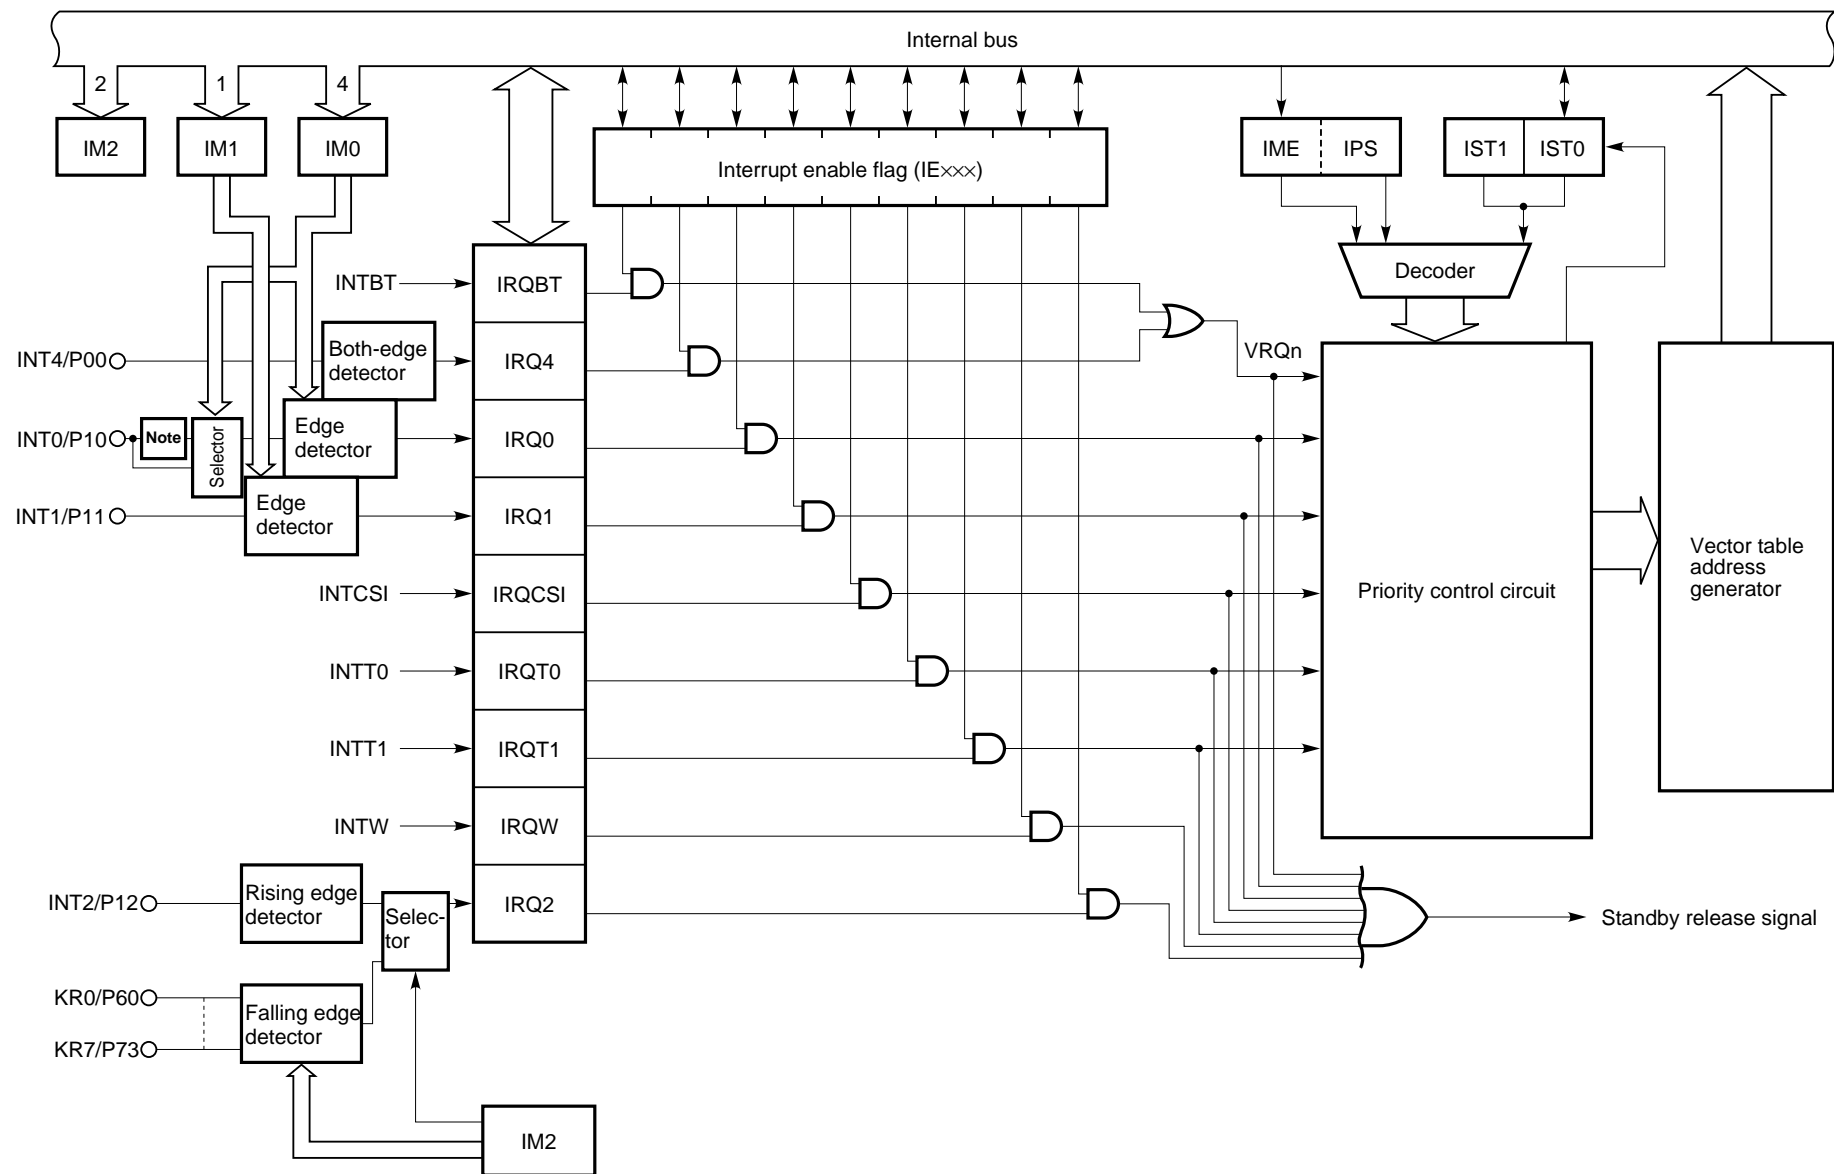

(1) Interrupt functions

- Hardware controlled vectored interrupt function which can control whether or not to accept an interrupt using the interrupt flag (IE $\times\times\times$) and interrupt master enable flag (IME).
- The interrupt start address can be set arbitrarily.
- Multiple interrupt function which can specify the priority by the interrupt priority specification register (IPS)
- Test function of an interrupt request flag (IRQ $\times\times\times$)
(The software can confirm that an interrupt occurred.)
- Release of the standby mode (Interrupts released by an interrupt enable flag can be selected.)

(2) Test functions

- Whether test request flags (IRQ $\times\times\times$) are issued can be checked with software.
- Release of the standby mode (A test source to be released can be selected with test enable flags.)

Figure 7-1. Interrupt Control Circuit Block Diagram

Note Noise eliminator (Standby release is not possible when the noise eliminator is selected.)

8. STANDBY FUNCTION

The μPD750108 has two different standby modes (STOP mode and HALT mode) to reduce power dissipation while waiting for program execution.

Table 8-1. Standby Mode Statuses

Item \ Mode		STOP mode	HALT mode
Instruction for setting		STOP instruction	HALT instruction
System clock for setting		Can be set only when operating on the main system clock.	Can be set either with the main system clock or the subsystem clock.
Operation status	Clock oscillator	The main system clock stops its operation.	Only the CPU clock Φ stops its operation (oscillation continues).
	Basic interval timer/watchdog timer	Does not operate.	Can operate only at main system clock oscillation. (BT mode : IRQBT is set at the reference interval. WT mode : A reset signal is generated when the BT overflows.)
	Serial interface	Can operate only when the external SCK input is selected for the serial clock.	Can operate only when external SCK input is selected as the serial clock or at main system clock oscillation.
	Timer/event counter	Can operate only when the TI0 pin input is selected for the count clock.	Can operate only when TI0 pin input is specified as the count clock or at main system clock oscillation.
	Timer counter	Does not operate.	Can operate. ^{Note 1}
	Clock timer	Can operate when f_{XT} is selected as the count clock.	Can operate.
	External interrupt	INT1, INT2, and INT4 can operate. Only INT0 cannot operate. ^{Note 2}	
	CPU	Does not operate.	
Release signal		An interrupt request signal from hardware whose operation is enabled by the interrupt enable flag or the generation of a RESET signal	

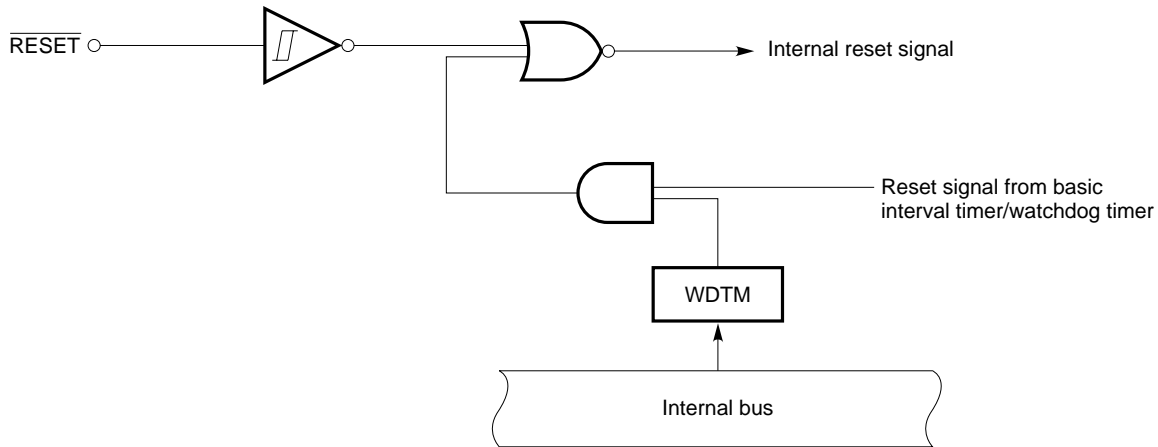

Notes 1. Operation is possible only when the main system clock operates.

2. Operation is possible only when the noise eliminator is not selected by bit 2 of the edge detection mode register (IM0) (when IM02 = 1).

9. RESET FUNCTION

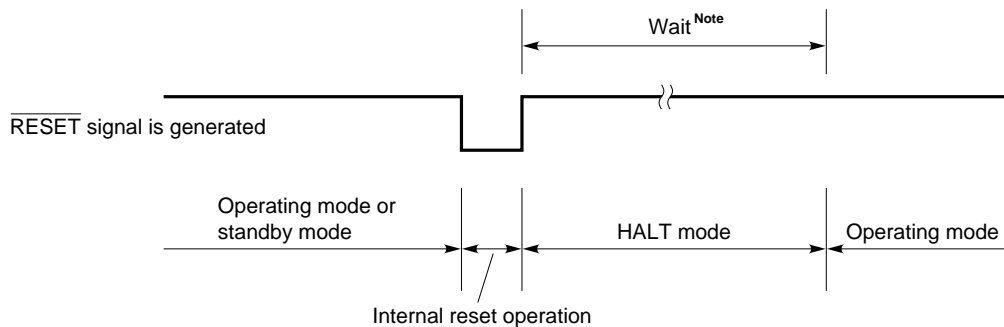

The μ PD750108 is reset with the external reset signal ($\overline{\text{RESET}}$) or the reset signal received from the basic interval timer/watchdog timer. When either reset signal is input, the internal reset signal is generated. Figure 9-1 shows the configuration of the reset circuit.

Figure 9-1. Configuration of Reset Functions

When the $\overline{\text{RESET}}$ signal is generated, all hardware is initialized as indicated in Table 9-1. Figure 9-2 shows the reset operation timing.

Figure 9-2. Reset Operation by Generation of $\overline{\text{RESET}}$ Signal

Note 56/fcc (28 μ s at 2.0 MHz, 56 μ s at 1.0 MHz)

Table 9-1. Status of the Hardware after a Reset (1/2)

Hardware		Generation of a $\overline{\text{RESET}}$ signal in a standby mode	Generation of a $\overline{\text{RESET}}$ signal during operation
Program counter (PC)	μ PD750104	4 low-order bits at address 0000H in program memory are set in PC bits 11 to 8, and the data at address 0001H are set in PC bits 7 to 0.	4 low-order bits at address 0000H in program memory are set in PC bits 11 to 8, and the data at address 0001H are set in PC bits 7 to 0.
	μ PD750106, 750108	5 low-order bits at address 0000H in program memory are set in PC bits 12 to 8, and the data at address 0001H are set in PC bits 7 to 0.	5 low-order bits at address 0000H in program memory are set in PC bits 12 to 8, and the data at address 0001H are set in PC bits 7 to 0.
PSW	Carry flag (CY)	Held	Undefined
	Skip flags (SK0 to SK2)	0	0
	Interrupt status flags (IST0, IST1)	0	0
	Bank enable flags (MBE, RBE)	Bit 6 at address 0000H in program memory is set in RBE, and bit 7 is set in MBE.	Bit 6 at address 0000H in program memory is set in RBE, and bit 7 is set in MBE.
Stack pointer (SP)		Undefined	Undefined
Stack bank selection register (SBS)		1000B	1000B
Data memory (RAM)		Held	Undefined
General-purpose registers (X, A, H, L, D, E, B, C)		Held	Undefined
Bank selection register (MBS, RBS)		0, 0	0, 0
Basic interval timer/watchdog timer	Counter (BT)	Undefined	Undefined
	Mode register (BTM)	0	0
	Watchdog timer enable flag (WDTM)	0	0
Timer/event counter	Counter (T0)	0	0
	Modulo register (TMOD0)	FFH	FFH
	Mode register (TM0)	0	0
	TOE0, TOUT flip-flop	0, 0	0, 0
Timer counter	Counter (T1)	0	0
	Modulo register (TMOD1)	FFH	FFH
	Mode register (TM1)	0	0
	TOE1, TOUT flip-flop	0, 0	0, 0
Clock timer	Mode register (WM)	0	0
Serial interface	Shift register (SIO)	Held	Undefined
	Operation mode register (CSIM)	0	0
	SBI control register (SBIC)	0	0
	Slave address register (SVA)	Held	Undefined

Table 9-1. Status of the Hardware after a Reset (2/2)

Hardware		Generation of a $\overline{\text{RESET}}$ signal in a standby mode	Generation of a $\overline{\text{RESET}}$ signal during operation
Clock generator, clock output circuit	Processor clock control register (PCC)	0	0
	System clock control register (SCC)	0	0
	Clock output mode register (CLOM)	0	0
Sub-oscillator control register (SOS)		0	0
Interrupt	Interrupt request flag (IRQ _{xxx})	Reset (0)	Reset (0)
	Interrupt enable flag (IE _{xxx})	0	0
	Priority selection register (IPS)	0	0
	INT0, INT1, and INT2 mode registers (IM0, IM1, IM2)	0, 0, 0	0, 0, 0
Digital ports	Output buffer	Off	Off
	Output latch	Clear (0)	Clear (0)
	I/O mode registers (PMGA, PMGB, PMGC)	0	0
	Pull-up resistor specification registers (POGA, POGB)	0	0
Bit sequential buffers (BSB0 to BSB3)		Held	Undefined

10. MASK OPTION

The μ PD750108 has the following mask options:

- Mask option of P40 to P43 and P50 to P53
Can specify whether to incorporate the pull-up resistor.
 - ① The pull-up resistor is incorporated bit by bit.
 - ② The pull-up resistor is not incorporated.
- Mask option of standby function
Can specify the wait time when STOP mode was released by an interrupt.
 - ① $2^9/f_{cc}$ (256 μ s at 2.0 MHz, 512 μ s at 1.0 MHz)
 - ② No wait
- Mask option of subsystem clock
Can specify whether to enable the built-in feedback resistor.
 - ① The built-in feedback resistor is enabled (it is turned on or off by software).
 - ② The built-in feedback resistor is disabled (it is cut by hardware).

11. INSTRUCTION SET

(1) Operand identifier and its descriptive method

The operands are described in the operand column of each instruction according to the descriptive method for the operand format of the appropriate instructions. (For details, refer to the **RA75X Assembler Package User's Manual: Language** (EEU-1363).) For descriptions in which alternatives exist, one element should be selected.

Capital letters and plus and minus signs are keywords; therefore, they should be described as they are.

For immediate data, the appropriate numerical values or labels should be described.

The symbols of register flags can be used as a label instead of mem, fmem, pmem, and bit. (For details, refer to the **μ PD750108 User's Manual** (U11330E).) However, there are some restrictions on usable labels for fmem and pmem.

Representation format	Description
reg	X, A, B, C, D, E, H, L
reg1	X, B, C, D, E, H, L
rp	XA, BC, DE, HL
rp1	BC, DE, HL
rp2	BC, DE
rp'	XA, BC, DE, HL, XA', BC', DE', HL'
rp'1	BC, DE, HL, XA', BC', DE', HL'
rpa	HL, HL+, HL-, DE, DL
rpa1	DE, DL
n4	4-bit immediate data or label
n8	8-bit immediate data or label
mem	8-bit immediate data or label
bit	2-bit immediate data or label
fmem	FB0H - FBFH, FF0H - FFFH immediate data or label
pmem	FC0H - FFFH immediate data or label
addr	0000H - 0FFFH immediate data or label (μ PD750104) 0000H - 17FFH immediate data or label (μ PD750106) 0000H - 1FFFH immediate data or label (μ PD750108)
addr1(for Mk II mode only)	0000H - 0FFFH immediate data or label (μ PD750104) 0000H - 17FFH immediate data or label (μ PD750106) 0000H - 1FFFH immediate data or label (μ PD750108)
caddr	12-bit immediate data or label
faddr	11-bit immediate data or label
taddr	20H - 7FH immediate data (however, bit 0 = 0) or label
PORTn	PORT0 - PORT8
IExxx	IEBT, IET0, IET1, IE0 - IE2, IE4, IECS, IEW
RBn	RB0 - RB3
MBn	MB0, MB1, MB15

Note Only even address can be specified for 8-bit data processing.

(2) Symbol definitions in operation description

A	: A register; 4-bit accumulator
B	: B register
C	: C register
D	: D register
E	: E register
H	: H register
L	: L register
X	: X register
XA	: Register pair (XA); 8-bit accumulator
BC	: Register pair (BC)
DE	: Register pair (DE)
HL	: Register pair (HL)
XA'	: Extended register pair (XA')
BC'	: Extended register pair (BC')
DE'	: Extended register pair (DE')
HL'	: Extended register pair (HL')
PC	: Program counter
SP	: Stack pointer
CY	: Carry flag; Bit accumulator
PSW	: Program status word
MBE	: Memory bank enable flag
RBE	: Register bank enable flag
PORT _n	: Port n (n = 0 to 8)
IME	: Interrupt master enable flag
IPS	: Interrupt priority specification register
IE _{xxx}	: Interrupt enable flag
RBS	: Register bank selection register
MBS	: Memory bank selection register
PCC	: Processor clock control register
.	: Address bit delimiter
(xx)	: Contents addressed by xx
xxH	: Hexadecimal data

(3) Symbols used for the addressing area column

* 1	MB = MBE • MBS (MBS = 0, 1, 15)	Data memory addressing
* 2	MB = 0	
* 3	MBE = 0: MB = 0 (000H - 07FH), MB = 15 (F80H - FFFH) MBE = 1: MB = MBS (MBS = 0, 1, 15)	
* 4	MB = 15, fmem = FB0H - FBFH, FF0H - FFFH	
* 5	MB = 15, pmem = FC0H - FFFH	
* 6	addr = 0000H - 0FFFH (μ PD750104), 0000H - 17FFH (μ PD750106) 0000H - 1FFFH (μ PD750108)	Program memory addressing
* 7	addr, addr1 = (Current PC) - 15 to (Current PC) - 1 (Current PC) + 2 to (Current PC) + 16	
* 8	caddr = 0000H - 0FFFH (μ PD750104) 0000H - 0FFFH (PC ₁₂ = 0: μ PD750106, 750108) 1000H - 17FFH (PC ₁₂ = 1: μ PD750106) 1000H - 1FFFH (PC ₁₂ = 1: μ PD750108)	
* 9	faddr = 0000H - 07FFH	
* 10	taddr = 0020H - 007FH	
* 11	Mk II mode only addr1 = 0000H - 0FFFH (μ PD750104) 0000H - 17FFH (μ PD750106) 0000H - 1FFFH (μ PD750108)	

Remarks 1. MB indicates the memory bank that can be accessed.

2. For *2, MB = 0 regardless of MBE and MBS settings.

3. For *4 and *5, MB = 15 regardless of MBE and MBS settings.

4. For *6 to *11, each addressable area is indicated.

(4) Description of machine cycle column

S indicates the number of machine cycles necessary for skipping any skip instruction. The value of S changes as follows:

- When no skip is performed : S = 0
- When a 1-byte or 2-byte instruction is skipped: S = 1
- When a 3-byte instruction^{Note} is skipped : S = 2

Note 3-byte instruction: BR !addr, BRA !addr1, CALL !addr, and CALLA !addr1 instructions.

Caution The GETI instruction is skipped in one machine cycle.

One machine cycle is equal to one cycle (= tcy) of the CPU clock (Φ), and four types of times are available for selection according to the PCC setting.

12. ELECTRICAL CHARACTERISTICS

ABSOLUTE MAXIMUM RATINGS ($T_A = 25\text{ }^{\circ}\text{C}$)

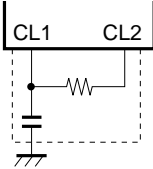

Parameter	Symbol	Conditions		Rated value	Unit
Supply voltage	V_{DD}			-0.3 to +7.0	V
Input voltage	V_{I1}	Other than ports 4 and 5		-0.3 to $V_{DD} + 0.3$	V
	V_{I2}	Ports 4 and 5	With a built-in pull-up resistor	-0.3 to $V_{DD} + 0.3$	V
			With N-ch open drain	-0.3 to +14.0	V
Output voltage	V_O			-0.3 to $V_{DD} + 0.3$	V
High-level output current	I_{OH}	Each pin		-10	mA
		Total of all pins		-30	mA
Low-level output current	I_{OL}	Each pin		30	mA
		Total of all pins		220	mA
Operating ambient temperature	T_A			-40 to +85	$^{\circ}\text{C}$
Storage temperature	T_{stg}			-65 to +150	$^{\circ}\text{C}$

Caution Absolute maximum ratings are rated values beyond which physical damage will be caused to the product; if the rated value of any of the parameters in the above table is exceeded, even momentarily, the quality of the product may deteriorate. Always use the product within its rated values.

CAPACITANCE ($T_A = 25\text{ }^{\circ}\text{C}$, $V_{DD} = 0\text{ V}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Input capacitance	C_{IN}	f = 1 MHz 0 V for pins other than pins to be measured			15	pF
Output capacitance	C_{OUT}				15	pF
I/O capacitance	C_{IO}				15	pF

CHARACTERISTICS OF THE MAIN SYSTEM CLOCK OSCILLATOR ($T_A = -40$ to $+85$ °C, $V_{DD} = 1.8$ to 5.5 V)

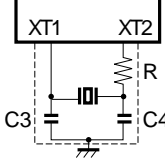

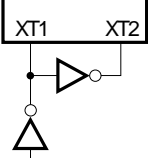

Resonator	Recommended constant	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
RC oscillator		Oscillator frequency (f_{cc}) ^{Note}		0.4		2.0	MHz

Note The oscillator frequency indicates only the oscillator characteristics. See AC characteristics for the instruction execution time and oscillator frequency characteristics.

Caution When the main system clock oscillator is used, conform to the following guidelines when wiring at the portions surrounded by dotted lines in the figures above to eliminate the influence of the wiring capacity.

- The wiring must be as short as possible.
- Other signal lines must not run in these areas.
- Any line carrying a high fluctuating current must be kept away as far as possible.
- The grounding point of the capacitor of the oscillator must have the same potential as that of V_{SS} .
- It must not be grounded to ground patterns carrying a large current.
- No signal must be taken from the oscillator.

CHARACTERISTICS OF THE SUBSYSTEM CLOCK OSCILLATOR ($T_A = -40$ to $+85$ °C, $V_{DD} = 1.8$ to 5.5 V)

Resonator	Recommended constant	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Crystal		Oscillator frequency (f_{XT}) ^{Note 1}		32	32.768	35	kHz
		Oscillation settling time ^{Note 2}	$V_{DD} = 4.5$ to 5.5 V		1.0	2	s
						10	s
External clock		XT1 input frequency (f_{XT}) ^{Note 1}		32		100	kHz
		XT1 input high/low level width (t_{XTH} , t_{XTL})		5		15	μs

Notes 1. The oscillator frequency and input frequency indicate only the oscillator characteristics. See the item of AC characteristics for the instruction execution time.

2. The oscillation settling time means the time required for the oscillation to settle after V_{DD} is applied.

Caution When the subsystem clock oscillator is used, conform to the following guidelines when wiring at the portions of surrounded by dotted lines in the figures above to eliminate the influence of the wiring capacity.

- The wiring must be as short as possible.
- Other signal lines must not run in these areas.
- Any line carrying a high fluctuating current must be kept away as far as possible.
- The grounding point of the capacitor of the oscillator must have the same potential as that of V_{SS}
- It must not be grounded to ground patterns carrying a large current.
- No signal must be taken from the oscillator.

When the subsystem clock is used, pay special attention to its wiring; the subsystem clock oscillator has low amplification to minimize current consumption and is more likely to malfunction due to noise than the main system clock oscillator.

				T _A = 25 °C		0.02	0.2	μA	

- Notes**
1. This current excludes the current which flows through the built-in pull-up resistors.
 2. This value applies also when the subsystem clock oscillates.
 3. Value when the processor clock control register (PCC) is set to 0011 and the μPD750108 is operated in the high-speed mode.
 4. Value when the PCC is set to 0000 and the μPD750108 is operated in the low-speed mode.
 5. This value applies when the system clock control register (SCC) is set to 1001 to stop the main system clock pulse and to start the subsystem clock pulse.
 6. Mode when the sub-oscillator control register (SOS) is set to 0000.
 7. Mode when the SOS is set to 0010.
 8. This value applies when the SOS is set to 00×1 and the sub-oscillator feedback resistor is not used (× = don't care).

AC CHARACTERISTICS ($T_A = -40$ to $+85$ °C, $V_{DD} = 1.8$ to 5.5 V)

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
CPU clock cycle time ^{Note 1} (minimum instruction execution time = 1 machine cycle)	t_{CY}	Operated by main system clock pulse		2.0		128	μ s
		Operated by subsystem clock pulse		114	122	125	μ s
TI0 input frequency	f_{TI}	$V_{DD} = 2.7$ to 5.5 V		0		1	MHz
				0		275	kHz
TI0 input high/low level width	t_{TIH} , t_{TIL}	$V_{DD} = 2.7$ to 5.5 V		0.48			μ s
				1.8			μ s
Interrupt input high/low level width	t_{INTH} , t_{INTL}	INT0	IM02 = 0	Note 2			μ s
			IM02 = 1	10			μ s
		INT1, INT2, and INT4		10			μ s
		KR0 to KR7		10			μ s
RESET low level width	t_{RSL}			10			μ s
RC oscillator frequency	f_{CC}	R = 22 k Ω , C = 22 pF	$V_{DD} = 2.7$ to 5.5 V	0.90	1.00	1.30	MHz
			$V_{DD} = 2.7$ to 5.5 V	0.55	1.00	1.30	MHz

Notes 1. When the main system clock is used, the cycle time of the CPU clock (Φ) (minimum instruction execution time) depends on the time constants of connected resistors (R) and capacitors (C) and the processor clock control register (PCC).

When the subsystem clock is used, the cycle time of the CPU clock (Φ) (minimum instruction execution time) depends on the frequency of the connected resonator (and external clock), the system clock control register (SCC), and the processor clock control register (PCC).

The figure on the right side shows the cycle time t_{CY} characteristics for the supply voltage V_{DD} during main system clock operation.

2. This value becomes $2t_{CY}$ or $128/f_{CC}$ according to the setting of the interrupt mode register (IM0).

SERIAL TRANSFER OPERATION

Two-wire and three-wire serial I/O modes ($\overline{\text{SCK}}$: Internal clock output): ($T_A = -40$ to $+85$ °C, $V_{DD} = 1.8$ to 5.5 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$\overline{\text{SCK}}$ cycle time	t_{KCY1}	$V_{DD} = 2.7$ to 5.5 V	1,300			ns
			3,800			ns
$\overline{\text{SCK}}$ high/low level width	$t_{\text{KL1}}, t_{\text{KH1}}$	$V_{DD} = 2.7$ to 5.5 V	$t_{\text{KCY1}}/2 - 50$			ns
			$t_{\text{KCY1}}/2 - 150$			ns
SI ^{Note 1} setup time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SIK1}	$V_{DD} = 2.7$ to 5.5 V	150			ns
			500			ns
SI ^{Note 1} hold time (referred to $\overline{\text{SCK}}\uparrow$)	t_{KSI1}	$V_{DD} = 2.7$ to 5.5 V	400			ns
			600			ns
Delay time from $\overline{\text{SCK}}\downarrow$ to SO ^{Note 1} output	t_{KSO1}	$R_L = 1 \text{ k}\Omega$ ^{Note 2} $C_L = 100 \text{ pF}$	$V_{DD} = 2.7$ to 5.5 V	0	250	ns
				0	1,000	ns

Notes 1. In two-wire serial I/O mode, SO should be read as SB0 or SB1.2. R_L is the resistance of the SO output line load, while C_L is the capacitance.Two-wire and three-wire serial I/O modes ($\overline{\text{SCK}}$: External clock input): ($T_A = -40$ to $+85$ °C, $V_{DD} = 1.8$ to 5.5 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$\overline{\text{SCK}}$ cycle time	t_{KCY2}	$V_{DD} = 2.7$ to 5.5 V	800			ns
			3,200			ns
$\overline{\text{SCK}}$ high/low level width	$t_{\text{KL2}}, t_{\text{KH2}}$	$V_{DD} = 2.7$ to 5.5 V	400			ns
			1,600			ns
SI ^{Note 1} setup time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SIK2}	$V_{DD} = 2.7$ to 5.5 V	100			ns
			150			ns
SI ^{Note 1} hold time (referred to $\overline{\text{SCK}}\uparrow$)	t_{KSI2}	$V_{DD} = 2.7$ to 5.5 V	400			ns
			600			ns
Delay time from $\overline{\text{SCK}}\downarrow$ to SO ^{Note 1} output	t_{KSO2}	$R_L = 1 \text{ k}\Omega$ ^{Note 2} $C_L = 100 \text{ pF}$	$V_{DD} = 2.7$ to 5.5 V	0	300	ns
				0	1,000	ns

Notes 1. In two-wire serial I/O mode, SO should be read as SB0 or SB1.2. R_L is the resistance of the SO output line load, while C_L is the capacitance.

SBI mode ($\overline{\text{SCK}}$: Internal clock output (master)): ($T_A = -40$ to $+85$ °C, $V_{DD} = 1.8$ to 5.5 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$\overline{\text{SCK}}$ cycle time	t_{KCY3}	$V_{DD} = 2.7$ to 5.5 V	1,300			ns
			3,800			ns
$\overline{\text{SCK}}$ high/low level width	$t_{\text{KL3}}, t_{\text{KH3}}$	$V_{DD} = 2.7$ to 5.5 V	$t_{\text{KCY3}}/2 - 50$			ns
			$t_{\text{KCY3}}/2 - 150$			ns
SB0/SB1 setup time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SIK3}	$V_{DD} = 2.7$ to 5.5 V	150			ns
			500			ns
SB0/SB1 hold time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SI3}		$t_{\text{KCY3}}/2$			ns
Delay time from $\overline{\text{SCK}}\downarrow$ to SB0/SB1 output	t_{SO3}	$R_L = 1 \text{ k}\Omega$ ^{Note} $C_L = 100 \text{ pF}$	$V_{DD} = 2.7$ to 5.5 V	0	250	ns
				0	1,000	ns
From $\overline{\text{SCK}}\uparrow$ to SB0/SB1 \downarrow	t_{KSB}		t_{KCY3}			ns
From SB0/SB1 \downarrow to $\overline{\text{SCK}}\downarrow$	t_{SBK}		t_{KCY3}			ns
SB0/SB1 low level width	t_{SBL}		t_{KCY3}			ns
SB0/SB1 high level width	t_{SBH}		t_{KCY3}			ns

Note R_L is the resistance of the SB0/SB1 output line load, while C_L is the capacitance.

SBI mode ($\overline{\text{SCK}}$: External clock input (slave)): ($T_A = -40$ to $+85$ °C, $V_{DD} = 1.8$ to 5.5 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$\overline{\text{SCK}}$ cycle time	t_{KCY4}	$V_{DD} = 2.7$ to 5.5 V	800			ns
			3,200			ns
$\overline{\text{SCK}}$ high/low level width	$t_{\text{KL4}}, t_{\text{KH4}}$	$V_{DD} = 2.7$ to 5.5 V	400			ns
			1,600			ns
SB0/SB1 setup time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SIK4}	$V_{DD} = 2.7$ to 5.5 V	100			ns
			150			ns
SB0/SB1 hold time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SI4}		$t_{\text{KCY4}}/2$			ns
Delay time from $\overline{\text{SCK}}\downarrow$ to SB0/SB1 output	t_{SO4}	$R_L = 1 \text{ k}\Omega$ ^{Note} $C_L = 100 \text{ pF}$	$V_{DD} = 2.7$ to 5.5 V	0	300	ns
				0	1,000	ns
From $\overline{\text{SCK}}\uparrow$ to SB0/SB1 \downarrow	t_{KSB}		t_{KCY4}			ns
From SB0/SB1 \downarrow to $\overline{\text{SCK}}\downarrow$	t_{SBK}		t_{KCY4}			ns
SB0/SB1 low level width	t_{SBL}		t_{KCY4}			ns
SB0/SB1 high level width	t_{SBH}		t_{KCY4}			ns

Note R_L is the resistance of the SB0/SB1 output line load, while C_L is the capacitance.

16. RECOMMENDED SOLDERING CONDITIONS

The μ PD750104, μ PD750106, and μ PD750108 should be soldered and mounted under the conditions recommended in the table below.

For detail of recommended soldering conditions, refer to the information document **SMD Surface Mount Technology Manual** (C10535E).

For soldering methods and conditions other than those recommended below, contact our sales personnel.

Table 16-1. Surface Mounting Type Soldering Conditions

μ PD750104GB-xxx-3BS-MTX	: 44-pin plastic QFP (10 × 10 mm, 0.8-mm pitch)
μ PD750106GB-xxx-3BS-MTX	: 44-pin plastic QFP (10 × 10 mm, 0.8-mm pitch)
μ PD750108GB-xxx-3BS-MTX	: 44-pin plastic QFP (10 × 10 mm, 0.8-mm pitch)
μ PD750104GB(A)-xxx-3BS-MTX	: 44-pin plastic QFP (10 × 10 mm, 0.8-mm pitch)
μ PD750106GB(A)-xxx-3BS-MTX	: 44-pin plastic QFP (10 × 10 mm, 0.8-mm pitch)
μ PD750108GB(A)-xxx-3BS-MTX	: 44-pin plastic QFP (10 × 10 mm, 0.8-mm pitch)

Soldering method	Soldering conditions	Symbol
Infrared reflow	Package peak temperature: 235 °C Duration: 30 seconds max. (at 210 °C or above) Maximum allowable number of reflow processes: 3	IR35-00-3
VPS	Package peak temperature: 215 °C Duration: 40 seconds max. (at 200 °C or above) Maximum allowable number of reflow processes: 3	VP15-00-3
Wave soldering	Solder bath temperature: 260 °C max. Duration: 10 seconds max. Number of times: 1 Preliminary heat temperature: 120 °C max. (package surface temperature)	WS60-00-1
Partial heating method	Terminal temperature: 300 °C max. Duration: 3 seconds max. (per device side)	-

Caution Use of more than one soldering method should be avoided (except for partial heating method).

Table 16-2. Insertion Type Soldering Conditions

μ PD750104CU-xxx	: 42-pin plastic shrink DIP (600 mil, 1.778-mm pitch)
μ PD750106CU-xxx	: 42-pin plastic shrink DIP (600 mil, 1.778-mm pitch)
μ PD750108CU-xxx	: 42-pin plastic shrink DIP (600 mil, 1.778-mm pitch)
μ PD750104CU(A)-xxx	: 42-pin plastic shrink DIP (600 mil, 1.778-mm pitch)
μ PD750106CU(A)-xxx	: 42-pin plastic shrink DIP (600 mil, 1.778-mm pitch)
μ PD750108CU(A)-xxx	: 42-pin plastic shrink DIP (600 mil, 1.778-mm pitch)

Soldering method	Soldering conditions
Wave soldering (terminal only)	Solder bath temperature: 260 °C max., Duration: 10 seconds max.
Partial heating method	Terminal temperature: 300 °C max., Duration: 3 seconds max. (for each pin)

Caution Apply wave soldering to terminals only. See to it that the jet solder does not contact with the chip directly.

APPENDIX A FUNCTIONS OF THE μ PD750008, μ PD750108, AND μ PD75P0116

(1/2)

Item		μPD750008	μPD750108	μPD75P0116
Program memory		Masked ROM 0000H - 1FFFFH (8,192 × 8 bits)		One-time PROM 0000H - 3FFFFH (16,384 × 8 bits)
Data memory		000H - 1FFFH (512 × 4 bits)		
CPU		75XL CPU		
General-purpose register		(4 bits × 8 or 8 bits × 4) × 4 banks		
Main system clock oscillator		Crystal/ceramic oscillator	RC oscillator (with external resistor and capacitor)	
Time required for start after reset		217/fx, 215/fx (selected using a mask option)	Fixed to 56/fcc	
Wait time applied when STOP mode is released by an interrupt		220/fx, 217/fx, 215/fx, 213/fx (selected according to BTM setting)	29/fcc or no wait (selected using a mask option)	Fixed to 29/fcc
Subsystem clock oscillator		Crystal oscillator		
Instruction execution time	When selecting the main system clock	•0.95, 1.91, 3.81, or 15.3 μs (when operating at fx =4.19 MHz) •0.67, 1.33, 2.67, or 10.7 μs (when operating at fx = 6.0 MHz)	•4, 8, 16, or 64 μs (when operating at fcc = 1.0 MHz) •2, 4, 8, or 32 μs (when operating at fcc = 2.0 MHz)	
	When selecting the subsystem clock	122 μs (when operating at 32.768 kHz)		
I/O port	CMOS input	8 (Built-in pull-up resistors that can be connected by software: 7)		
	CMOS I/O	18 (Built-in pull-up resistors that can be connected by software)		
	N-ch open-drain I/O	8 (Pull-up resistors that can be incorporated by mask option) Withstand voltage of 13 V		8 (No mask option) Withstand voltage of 13 V
	Total	34		
Timer		4 channels •8-bit timer counter: 1 •8-bit timer/event counter: 1 •Basic interval timer/watchdog timer: 1 •Clock timer: 1	4 channels •8-bit timer counter (clock timer output function provided): 1 •8-bit timer/event counter: 1 •Basic interval timer/watchdog timer: 1 •Clock timer: 1	

(2/2)

Item	μ PD750008	μ PD750108	μ PD75P0116
Serial interface	3 modes supported • Three-wire serial I/O mode: First transferred bit switchable between LSB and MSB • Two-wire serial I/O mode • SBI mode		
Clock output (PCL)	<ul style="list-style-type: none">• Φ, 524, 262, or 65.5 kHz (when the main system clock operates at 4.19 MHz)• Φ, 750, 375, or 93.8 kHz (when the main system clock operates at 6.0 MHz)	<ul style="list-style-type: none">• Φ, 125, 62.5, or 15.6 kHz (when the main system clock operates at 1.0 MHz)• Φ, 250, 125, or 31.3 kHz (when the main system clock operates at 2.0 MHz)	
Buzzer output (BUZ)	<ul style="list-style-type: none">• 2, 4, or 32 kHz (when the main system clock operates at 4.19 MHz or the subsystem clock operates at 32.768 kHz)• 2.93, 5.86, or 46.9 kHz (when the main system clock operates at 6.0 MHz)	<ul style="list-style-type: none">• 2, 4, or 32 kHz (when the subsystem clock operates at 32.768 kHz)• 0.488, 0.977, or 7.813 kHz (when the main system clock operates at 1.0 MHz)• 0.977, 1.953, or 15.625 kHz (when the main system clock operates at 2.0 MHz)	
Vectored interrupt	External: 3, internal: 4		
Test input	External: 1, internal: 1		
Supply voltage	$V_{DD} = 2.2$ to 5.5 V	$V_{DD} = 1.8$ to 5.5 V	
Operating ambient temperature	$T_A = -40$ to +85 °C		
Package	<ul style="list-style-type: none">• 42-pin plastic shrink DIP (600 mil, 1.778-mm pitch)• 44-pin plastic QFP (10 × 10 mm, 0.8-mm pitch)		

APPENDIX B DEVELOPMENT TOOLS

The following development tools are provided for the development of a system which employs the μPD750108. In the 75XL series, use the common relocatable assembler together with a device file of each model.

Language processors

RA75X relocatable assembler	Host machine	OS	Distribution media	Part number
	PC-9800 series	MS-DOSTM Ver. 3.30 to Ver. 6.2 ^{Note}	3.5-inch 2HD	μS5A13RA75X
			5.25-inch 2HD	μS5A10RA75X
	IBM PC/AT™ and compatibles	See "OS for IBM PC."	3.5-inch 2HC	μS7B13RA75X
			5.25-inch 2HC	μS7B10RA75X

Device file	Host machine	OS	Distribution media	Part number
	PC-9800 series	MS-DOS Ver. 3.30 to Ver. 6.2 ^{Note}	3.5-inch 2HD	μS5A13DF750008
			5.25-inch 2HD	μS5A10DF750008
	IBM PC/AT and compatibles	See "OS for IBM PC."	3.5-inch 2HC	μS7B13DF750008
			5.25-inch 2HC	μS7B10DF750008

Note These software products cannot use the task swap function, which is available in MS-DOS Ver. 5.00 or later.

Remark The operations of the assembler and device file are guaranteed only on the above host machines and OSs.

PROM programming tools

Hardware	PG-1500	The PG-1500 PROM programmer is used together with an accessory board and optional program adapter. It allows the user to program a single chip microcontroller containing PROM from a standalone terminal or a host machine. The PG-1500 can be used to program typical 256K-bit to 4M-bit PROMs.		
	PA-75P008CU	The PA-75P008CU is a PROM programmer adapter provided for the μPD75P0116CU/GB. It is used in conjunction with the PG-1500.		
Software	PG-1500 controller	This program enables the host machine to control the PG-1500 through the serial and parallel interfaces.		
		Host machine	OS	Part number
		PC-9800 series	MS-DOS Ver. 3.30 to Ver. 6.2 ^{Note}	3.5-inch 2HD
				5.25-inch 2HD
		IBM PC/AT and compatibles	See "OS for IBM PC."	μS5A13PG1500
				μS5A10PG1500
				μS7B13PG1500
				μS7B10PG1500

Note These software products cannot use the task swap function, which is available in MS-DOS Ver. 5.00 or later.

Remark Operation of the PG-1500 controller is guaranteed only on the above host machines and OSs.

Debugging tools

The in-circuit emulators (IE-75000-R and IE-75001-R) are provided to debug programs used for the μ PD750108. The system configuration is shown below.

Hardware	IE-75000-R ^{Note 1}	<p>The IE-75000-R is an in-circuit emulator used to debug hardware and software when developing an application system using the 75X series and 75XL series. Use this emulator together with optional emulation board IE-75300-R-EM and emulation probe EP-75008CU-R or EP-75008GB-R to develop application systems of the μPD750108 subseries.</p> <p>For efficient debugging, connect the emulator to the host machine and a PROM programmer.</p> <p>The IE-75000-R contains emulation board IE-75000-R-EM. The board is connected to the IE-75000-R.</p>		
	IE-75001-R	<p>The IE-75001-R is an in-circuit emulator used to debug hardware and software when developing an application system using the 75X series and 75XL series. Use this emulator together with optional emulation board IE-75300-R-EM and emulation probe EP-75008CU-R or EP-75008GB-R to develop application systems of the μPD750108 subseries.</p> <p>For efficient debugging, connect the emulator to the host machine and a PROM programmer.</p>		
	IE-75300-R-EM	<p>The IE-75300-R-EM is an emulation board used to evaluate an application system using the μPD750108 subseries.</p> <p>Use this board together with the IE-75000-R or IE-75001-R.</p>		
	EP-75008CU-R	<p>The EP-75008CU-R is an emulation probe for the μPD750108CU.</p> <p>Connect this emulation probe to the IE-75000-R or IE-75001-R, and the IE-75300-R-EM.</p>		
	EP-75008GB-R	<p>The EP-75008GB-R is an emulation probe for the μPD750108GB.</p> <p>Connect this emulation probe to the IE-75000-R or IE-75001-R, and the IE-75300-R-EM.</p>		
	EV-9200G-44	<p>A 44-pin conversion socket, the EV-9200G-44, supplied with this probe facilitates the connection of the probe to the target system.</p>		
Software	IE control program	<p>This program enables the host machine to control the IE-75000-R or IE-75001-R through the RS-232-C and Centronics interface.</p>		
		Host machine	OS	Distribution media
		PC-9800 series	MS-DOS Ver. 3.30 to Ver. 6.2 ^{Note 2}	3.5-inch 2HD
				5.25-inch 2HD
		IBM PC/AT and compatibles	See "OS for IBM PC."	3.5-inch 2HC
				5.25-inch 2HC

Notes 1. Maintenance service only

2. These software products cannot use the task swap function, which is available in MS DOS Ver. 5.00 or later.

Remarks 1. Operation of the IE control program is guaranteed only on the above host machines and OSs.

2. The μ PD750104, μ PD750106, μ PD750108, and μ PD75P0116 are collectively called the μ PD750108 subseries.

OS for IBM PC

The following IBM PC OSs are supported.

OS	Version
PC DOSTM	Ver. 5.02 to Ver. 6.3 J6.1/VNote to J6.3/VNote
MS-DOS	Ver. 5.0 to Ver. 6.22 5.0/VNote to 6.2/VNote
IBM DOSTM	J5.02/VNote

Note Only English version is supported.

Caution These software products cannot use the task swap function, which is available in MS-DOS Ver. 5.0 or later.

APPENDIX C RELATED DOCUMENTS

Some documents are preliminary editions, but they are not so specified in the tables below.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

IBM DOS, PC/AT, and PC DOS are trademarks of IBM Corporation.

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
