

Description

The NEC μ PD8039HL, μ PD8049H and the μ PD8749H are high performance, single component, 8-bit parallel microcomputers using n-channel silicon gate MOS technology. The processors differ only in their internal program memory options: the μ PD8049H has $2K \times 8$ bytes of mask ROM, the μ PD8749H has $2K \times 8$ of UV erasable EPROM and the μ PD8039HL has external program memory.

The μ PD8049H family functions efficiently in control as well as arithmetic applications. The powerful instruction set eases bit handling applications and provides facilities for binary and BCD arithmetic. Standard logic functions implementation is facilitated by the large variety of branch and table look-up instructions. The instruction set is comprised of 1 and 2 byte instructions, most of which are single-byte. The instruction set requires only 1 or 2 cycles per instruction with over 50 percent of the instructions single-cycle.

The μ PD8049H family of microprocessors will function as stand-alone microcomputers. Their functions can easily be expanded using standard 8080A/8085A peripherals and memories. The μ PD8039HL is intended for applications using external program memory only. It contains all the features of the μ PD8049H except for the internal ROM. The external program memory can be implemented using standard 8080A/8085A memory products. The μ PD8049H contains the following functions usually found in external peripheral devices: 2048×8 bits of mask ROM program memory; 128×8 bits of RAM data memory; 27 I/O lines; an 8-bit interval timer/event counter; and oscillator and clock circuitry. The μ PD8749H differs from the μ PD8049H in its 2048×8 -bit UV erasable EPROM program memory instead of the mask ROM memory. It is useful in preproduction or prototype applications where the software design has not yet been finalized or in system designs whose quantities do not require a mask ROM.

Features

- ☐ External and internal interrupts
- ☐ 96 instructions: 70 percent single byte
- ☐ 27 I/O lines
- ☐ Internal clock generator
- ☐ Expandable with 8080A/8085A peripherals
- ☐ HMOS silicon gate technology
- ☐ Single $+5V \pm 10$ percent power supply

Ordering Information

Part Number	Package Type	Max Frequency of Operation
μ PD8039HLC	40-pin plastic DIP	11 MHz
μ PD8049HC	40-pin plastic DIP	11 MHz
μ PD8749HC	40-pin plastic DIP	11 MHz
μ PD8749HD	40-pin cerdip (Note 1)	11 MHz

Note:

(1) With quartz window.

Pin Configuration

83-002879A

Pin Identification

No.	Symbol	Function
1	T0	Test 0 input/output
2	XTAL1	Crystal 1 input
3	XTAL2	Crystal 2 input
4	$\overline{\text{RESET}}$	Reset input
5	$\overline{\text{SS}}$	Single step input
6	$\overline{\text{INT}}$	Interrupt input
7	EA	External access input
8	$\overline{\text{RD}}$	Read output
9	$\overline{\text{PSEN}}$	Program store enable output
10	$\overline{\text{WR}}$	Write output
11	ALE	Address latch enable output
12–19	DB ₀ –DB ₇	Bidirectional data bus
20	V _{SS}	Ground
21–24	P ₂₀ –P ₂₇	Quasi-bidirectional Port 2
25, 35–38	PROG	Program output
26	V _{DD}	RAM power supply
27–34	P ₁₀ –P ₁₇	Quasi-bidirectional Port 1
39	T1	Test 1 input
40	V _{CC}	Primary power supply

Pin Functions

XTAL 1 (Crystal 1)

XTAL1 is one side of the crystal, LC, or external frequency source (non-TTL-compatible V_{IH}).

XTAL 2 (Crystal 2)

XTAL2 is the other side of the crystal or frequency source. For external sources, XTAL2 must be driven with the logical complement of the XTAL1 input.

T0 (Test 0)

T0 is the testable input using conditional transfer functions JT0 and JNT0. The internal state clock (CLK) is available to T0 using the ENT0 CLK instruction. T0 can also be used during programming as a testable flag.

T1 (Test 1)

T1 is the testable input using conditional transfer functions JT1 and JNT1. T1 can be made the counter/timer input using the STRT CNT instruction.

$\overline{\text{RESET}}$ (Reset)

An active low on $\overline{\text{RESET}}$ initializes the processor. $\overline{\text{RESET}}$ is also used for PROM programming verification and power-down (non-TTL compatible V_{IH}).

$\overline{\text{SS}}$ (Single Step)

An active low on $\overline{\text{SS}}$, together with ALE, causes the processor to execute the program one step at a time.

$\overline{\text{INT}}$ (Interrupt)

An active low on $\overline{\text{INT}}$ starts an interrupt if interrupts are enabled. A reset disables an interrupt. $\overline{\text{INT}}$ can be tested with the JN1 instruction and, depending on the results, a jump to the specified address can occur.

EA (External Access)

An active high on EA disables internal program memory and fetches and accesses external program memory. EA is used for system testing and debugging.

$\overline{\text{RD}}$ (Read)

$\overline{\text{RD}}$ will pulse low when the processor performs a bus read. An active low on $\overline{\text{RD}}$ enables data onto the processor bus from a peripheral device and functions as a read strobe for external data memory.

$\overline{\text{WR}}$ (Write)

$\overline{\text{WR}}$ will pulse low when the processor performs a bus write. $\overline{\text{WR}}$ can also function as a write strobe for external data memory.

$\overline{\text{PSEN}}$ (Program Store Enable)

$\overline{\text{PSEN}}$ becomes active only during an external memory fetch. (Active low).

ALE (Address Latch Enable)

ALE occurs at each cycle. ALE can also be used as a clock output. The falling edge of ALE addresses external data memory or external program memory.

DB₀–DB₇ (Data Bus)

DB₀–DB₇ is a bidirectional port. Synchronous reads and writes can be performed on this port using $\overline{\text{RD}}$ and $\overline{\text{WR}}$ strobes. The contents of the DB₀–DB₇ bus can be latched in a static mode.

During an external memory fetch, DB₀–DB₇ output the low order eight bits of the memory address. $\overline{\text{PSEN}}$ fetches the instruction. DB₀–DB₇ also output the address of an external data memory fetch. The addressed data is controlled by ALE, $\overline{\text{RD}}$, and $\overline{\text{WR}}$.

P₁₀–P₁₇ (Port 1)

P₁₀–P₁₇ is an 8-bit quasi-bidirectional port.

P2₀-P2₇ (Port 2)

P2₀-P2₇ is an 8-bit quasi-bidirectional port. P2₀-P2₃ output the high order four bits of the address during an external program memory fetch. P2₀-P2₃ also function as a 4-bit I/O bus for the μ PD82C43 I/O port expander.

PROG (Program Pulse)

PROG is used as an output pulse during a fetch when interfacing with the μ PD82C43 I/O port expander. When the μ PD8049H is used in a stand-alone mode, PROG can be allowed to float.

VCC (Primary Power Supply)

VCC is the primary power supply. VCC is +5V during normal operation.

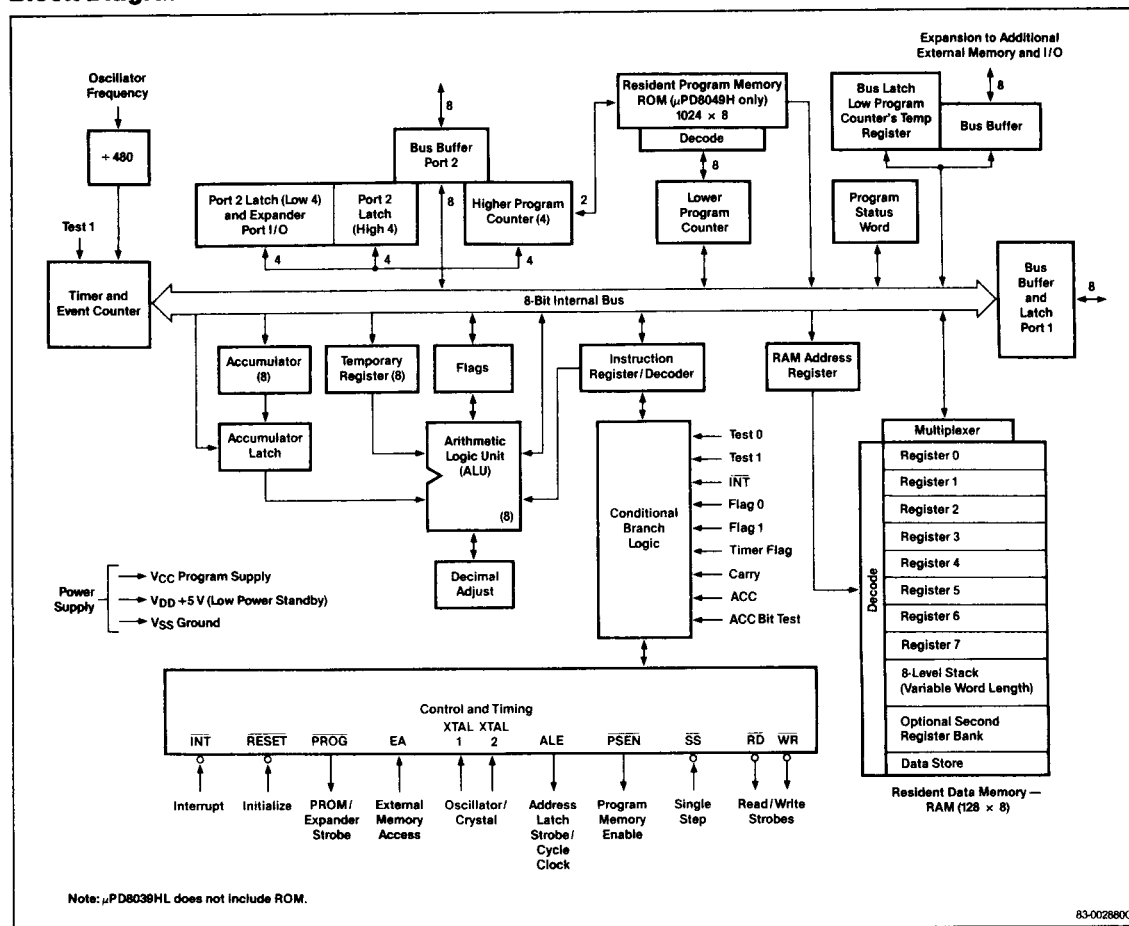

VDD (RAM Power Supply)

VDD provides +5V to the 128 \times 8-bit RAM section. During normal operation, VCC must also be +5V to provide power to the other functions in the device. During standby operation, VDD must remain at +5V while VCC is at ground potential.

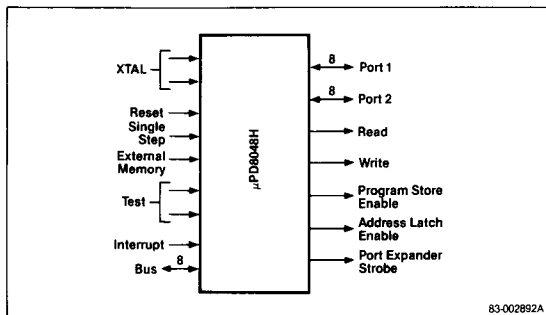

VSS (Ground)

VSS is ground potential.

Block Diagram

Logic Symbol

Absolute Maximum Ratings

$T_A = 25^\circ\text{C}$

Operating temperature, T_{OPT}	0°C to $+70^\circ\text{C}$
Storage temperature, T_{STG}	-65°C to $+150^\circ\text{C}$
Voltage on any pin	-0.5 V to $+7.0\text{ V}$ (Note 1)
Power dissipation, P_D	1.5 W

Note:

(1) With respect to ground.

Comment: Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of the specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC Characteristics

$T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$, $V_{CC} = V_{DD} = +5\text{ V} \pm 10\%$, $V_{SS} = 0\text{ V}$

Parameter	Symbol	Limits			Unit	Test Conditions
		Min	Typ	Max		
Input low voltage (All except XTAL1, XTAL2)	V_{IL}	-0.5		0.8	V	
Input high voltage (All except XTAL1, XTAL2, RESET)	V_{IH}	2.0		V_{CC}	V	
Input high voltage (XTAL1, XTAL2, RESET)	V_{IH1}	3.8		V_{CC}	V	
Output low voltage (BUS, RD, WR, PSEN, ALE)	V_{OL}		0.45		V	$I_{OL} = 2.0\text{ mA}$
Output low voltage (All others except PROG)	V_{OL1}		0.45		V	$I_{OL} = 2.0\text{ mA}$
Output low voltage (PROG)	V_{OL2}		0.45		V	$I_{OL} = 2.0\text{ mA}$

Parameter	Symbol	Limits			Unit	Test Conditions
		Min	Typ	Max		
Output high voltage (***)	V_{OH}	2.4			V	$I_{OH} = -400\text{ }\mu\text{A}$
Output high voltage (RD, WR, PSEN, ALE)	V_{OH1}	2.4			V	$I_{OH} = -400\text{ }\mu\text{A}$
Output high voltage (all other outputs)	V_{OH2}	2.4			V	$I_{OH} = -40\text{ }\mu\text{A}$
Input leakage current (T1, EA, INT)	I_{IL}			± 10	μA	$V_{SS} \leq V_{IN} \leq V_{CC}$
Input leakage current ($P1_0$ - $P1_7$, $P2_0$ - $P2_7$, EA, SS)	I_{IL1}			-500	μA	$V_{SS} + 0.45\text{ V} \leq V_{IN} \leq V_{CC}$
Output leakage current (BUS, T0, high impedance state)	I_{LO}			± 10	μA	$V_{CC} \geq V_{IN} \geq V_{SS} + 0.45\text{ V}$
Power down supply current	I_{DD}		5	10	mA	$T_A = 25^\circ\text{C}$
			2	5		8749H only
Total supply current	$I_{DD} + I_{CC}$		80	110	mA	$T_A = 25^\circ\text{C}$
			85	110		8749H only

DC Programming Characteristics

$T_A = 25^\circ\text{C} \pm 5^\circ\text{C}$, $V_{CC} = +5\text{ V} \pm 5\%$, $V_{DD} = +21\text{ V} \pm 0.5\text{ V}$

Parameter	Symbol	Limits			Unit	Test Conditions
		Min	Typ	Max		
V_{DD} program voltage high level	V_{DDH}	20.5		21.5	V	
V_{DD} program voltage low level	V_{DDL}	4.75		5.25	V	
PROG program voltage high level	V_{PH}	17.5		18.5	V	
PROG voltage low level	V_{PL}	4.0		V_{CC}	V	
EA program / verify voltage high level	V_{EAH}	17.5		18.5	V	
V_{DD} high voltage supply current	I_{DD}			20.0	mA	
PROG high voltage supply current	I_{PROG}			1.0	mA	
EA high voltage supply current	I_{EA}			1.0	mA	

AC Characteristics

$T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$, $V_{CC} = V_{DD} = +5\text{V} \pm 10\%$, $V_{SS} = 0\text{V}$

Parameter	Symbol	Limits			Unit	Test Conditions

RET	(SP) ← (SP) = 1 (PC) ← ((SP))	Return from subroutine without restoring program status word.	1	0	0	0	0	0	1	1	2	1					
RETR	(SP) ← (SP) = 1 (PC) ← ((SP)) (PSW ₄ –PSW ₇) ← ((SP))	Return from subroutine restoring program status word.	1	0	0	1	0	0	1	1	2	1					
Timer / Counter																	
EN TCNTI		Enable internal interrupt flag for timer / counter output.	0	0	1	0	0	1	0	1	1	1					
DIS TCNTI		Disable internal interrupt flag for timer / counter output.	0	0	1	1	0	1	0	1	1	1					
MOV A, T	(A) ← (T)	Move contents of timer / counter into accumulator.	0	1	0	0	0	0	1	0	1	1					
MOV T, A	(T) ← (A)	Move contents of accumulator into timer / counter.	0	1	1	0	0	0	1	0	1	1					
STOP TCNT		Stop count for event counter.	0	1	1	0	0	1	0	1	1	1					
STRT CNT		Start count for event counter.	0	1	0	0	0	1	0	1	1	1					
STRT T		Start count for timer.	0	1	0	1	0	1	0	1	1	1					
Miscellaneous																	
NOP		No operation performed.	0	0	0	0	0	0	0	0	1	1					

Note:

- (1) Operation code designations r and p form the binary representation of the registers and ports involved.
- (2) The dot under the appropriate flag bit indicates that its contents are subject to change by the instruction it appears in.
- (3) References to the address and data are specified in bytes 2 and/or 1 of the instruction.
- (4) Numerical subscripts appearing in the function column reference the specific bits affected.
- (5) When the bus is written to with an OUTL instruction, the bus remains an output port until either the device is reset or a MOVX instruction is executed.

Instruction Set Symbol Definitions

Symbol	Description
A	Accumulator
AC	Auxiliary carry flag
addr	Program memory address (12 bits)
B _b	Bit designator (b = 0–7)
BS	Bank switch
BUS	Bus port
C	Carry flag
CLK	Clock signal
CNT	Event counter
D	Nibble designator (4 bits)
data	Number of expression (8 bits)
DBF	Memory bank flip-flop
F0, F1	Flags 0, 1
I	Interrupt
P	“In-page” operation designator
Pp	Port designator (p = 1, 2 or 4–7)
PSW	Program status word
Rr	Register designator (r = 0, 1 or 0–7)
SP	Stack pointer
T	Timer
TF	Timer flag
T0, T1	Testable flags 0, 1
X	External RAM
#	Prefix for immediate data
@	Prefix for indirect address
\$	Program counter's current value
(x)	Contents of external RAM location
((x))	Contents of memory location addressed by the contents of external RAM location
←	Replaced by
AND	Logical product (logical AND)
OR	Logical sum (logical OR)
EXOR	Exclusive-OR

Operating Characteristics

Bus Output High Voltage vs. Source Current

Port P1 & P2 Output High Voltage vs. Source Current

Bus Output Low Voltage vs. Sink Current
