

# 8-BIT SERIAL TO PARALLEL CONVERTER

## GENERAL DESCRIPTION

The NJU3712 is an 8-bit serial to parallel converter especially apply to MPU output expander.

The effective output assignment of MPU is available as the connection between NJU3712 and MPU is required only 4 lines.

Up to 5MHz signal can be input to the serial data input terminal and the data is output from parallel output buffer through serial in parallel out shift register and parallel data latches.

Furthermore, the NJU3712 output the serial data from SO terminal through the shift register, therefore output bit number can increase by cascade connection.

The hysteresis input circuit realized wide noise margin and high driverbility output buffer ( 25mA ) can drive LED directly.

## PACKAGE OUTLINE

NJU3712D

NJU3712M

7

## FEATURES

- 8-Bit Serial In Parallel Out
- Cascade Connection
- Hysteresis Input ----- 0.5V typ
- Operating Voltage -----  $5V \pm 10\%$
- Operating Frequency ----- 5MHz or more
- Output Current ----- 25mA
- C-MOS Technology
- Package Outline ----- DIP/DMP 16

## PIN CONFIGURATION

## BLOCK DIAGRAM

## ■ TERMINAL DESCRIPTION

NO.	SYMBOL	F U N C T I O N	NO.	SYMBOL	F U N C T I O N
1	P3	Parallel Converts Data Output Terminals	9	DATA	Serial Data Input Terminal
2	P4		10	CLK	Clock Signal Input Terminal
3	P5		11	STB	Strobe Signal Input Terminal
4	V <sub>SS</sub>	GND	12	CLR	Clear Signal Input Terminal
5	P6	Parallel Converts Data Output Terminals	13	V <sub>SS</sub>	GND
6	P7		14	P1	Parallel Converts Data Output Terminals
7	P8		15	P2	
8	S0	Serial Data Output Terminal	16	V <sub>DD</sub>	Power Supply Terminal

## ■ FUNCTIONAL DESCRIPTION

### (1) Reset

When the "L" level is input to the  $\overline{\text{CLR}}$  terminal, all latches are reset and all parallel conversion output are "L" level.

Normally, the  $\overline{\text{CLR}}$  terminal should be "H" level.

### (2) Data Transmission

In the STB terminal is "H" level and input the clock signal to the CLK terminal, the serial data input from DATA terminal shift in the shift register by synchronizing at rising edge of the clock signal.

When the  $\overline{\text{STB}}$  terminal change to "L" level, the data in the shift register transfer to the latch.

Even if the STB terminal is "L" level, the input clock signal shift the data in the shift register, therefore, the clock signal control is needed.

### (3) Cascade Connection

The serial data input from DATA terminal output from the S0 terminal through internal shift register unrelated the  $\overline{\text{CLR}}$  and  $\overline{\text{STB}}$  status.

Furthermore, the 4 input terminals have a hysteresis characteristics by using the schmitt trigger structure to protect the noise.

CLK	STB	CLR	O P E R A T I O N
X	X	L	All latch are reset (the data in the shift register is no change). All of Parallel convert output are "L".
	H	H	The serial data input from DATA terminal input to the shift register. In this stage, the data in the latch is no change.
L	L	H	The data in the shift register transfer to the latch. And the data in the latch output from parallel output.
H			
			
			The CLK input in the $\overline{\text{STB}}=\text{"L"}$ and $\overline{\text{CLR}}=\text{"H"}$ state, the data shift in the shift register and latched data also change in accordance with the shift register.

Note ) X: Don't care
