

## 12-Character 4-Line Dot Matrix Low Power

### LCD Controller Driver with key Scan Function

#### ■ GENERAL DESCRIPTION

The NJU6475B is a Dot Matrix LCD Controller Driver for 12-character 4-line with Icon display in single chip. It contains voltage converter, voltage regulator, bleeder resistance, CR oscillator, instruction decoder, character generator ROM/RAM, high voltage operation controller/driver and key scan circuit.

The voltage converter generates (about 8V) from the supply voltage (3V) and regulated by the regulator. The bias level of LCD driving voltage is generated of high value bleeder resistance and the buffer amplifier matches the impedance. 16-step contrast control function is incorporated for its adjustment. Therefore, simple power supply circuit and easy contrast adjustment are available. The complete CR oscillator is incorporated without external components for oscillation circuit. The microprocessor interface circuit which operates by 1MHz, can be selected serial interface.

The character generator ROM consisting of 10,080bits stores 252 kinds of character Font.

Each 160bits CG RAM and Icon display RAM can store 4 kinds of special character to display on the dot matrix display area or 128 kinds of Icon on the display area.

#### ■ PACKAGE OUTLINE

NJU6475B

#### ■ FEATURES

- 12-Character 4-Line Dot Matrix LCD Controller Driver
- Maximum 128-Icon Display
- Serial CPU Interface
- Display Data RAM - 48 x 8 Bits :Maximum 12-Character 4-Line Display
- Character Generator ROM - 10,080 Bits:252 Characters (5 x 8 Dots)
- Character Generator RAM - 32 x 5 Bits :4 Patterns (5 x 8 Dots)
- Icon Display RAM - 32 x 5 Bits :Maximum 128-Icon
- High Voltage LCD Driver : 37-Common/63-Segment
- Duty & Bias Ratio : 1/36 duty 1/7Bias
- Useful Instruction Set : Clear Display, Return Home, Display On/Off Control  
Display Blink, Cursor Shift, Character Shift
- Common and Segment Driver location Order Select Function (Mode-A, Mode-B)
- Power On Reset Circuit On Chip
- Hardware Reset
- Voltage Regulator On Chip
- Electrical Variable Resistance On Chip
- 32-key scan function (8 x 4 Matrix)
- Oscillation circuit On Chip
- Voltage Converter (Doubler, Tripler) On Chip
- Bleeder Resistance On Chip
- Low Operating Current
- Operating Voltage - 2.4V to 3.6V (Except For LCD Driving Voltage)
- Package Outline - Bumped-Chip / TCP
- C-MOS Technology

# NJU6475B

## ■ TERMINAL DESCRIPTION

PAD No.	Symbol	I/O	F u n c t i o n
11,5	$V_{DD}, V_{SS}$	-	Power Source : $V_{DD}=+3V$ GND : $V_{SS}=0V$
4	$V_5$	-	LCD driving voltage
2,3	OSC <sub>1</sub> , OSC <sub>2</sub>	I/O	System clock terminal Oscillation C and R are incorporated. (Normally Open) For external clock operation, the clock should be input on OSC <sub>1</sub> .
17	P/S	I	Serial input select terminal (fixed to "L")
18	RS	I	Register selection signal input terminal "0" instruction register. (Writing) "1" Data register. (Writing, Reading)
19	R/W	I	Read(R) / Write(W) selection signal input terminal
20	E/SCL	I	Serial clock input terminal
23	DB <sub>7</sub> /CS	I	Chip select signal
24	DB <sub>6</sub> /SIO	I/O	Data input terminal (3-state data bus.)
25 - 30	DB <sub>0</sub> - DB <sub>5</sub>	I	I/O port output terminal
22	REQ	O	This terminal normally output "L". When confirm a key action, REQ terminal output puls.
21	LCD/KEY	I	Fix to "H" Level
35 - 42	S <sub>0</sub> - S <sub>7</sub>	O	Key scan signal data output terminal Open Drain Output
31 - 34	K <sub>0</sub> - K <sub>3</sub>	I	Key scan data input terminal In case of non use, fix to "H".
158 - 151 65 - 72 150 - 143 73 - 80	COM <sub>1</sub> - COM <sub>32</sub>	O	Common signal output terminal
162 - 159	COMM <sub>1</sub> - COMM <sub>4</sub>	O	Icon common display signal output terminal
163	COMS <sub>1</sub>	O	Static driving common signal output terminal When power down mode $V_{DD}$ or $V_{SS}$ levels are output.
82 - 141	SEG <sub>1</sub> - SEG <sub>60</sub>	O	Segment signal output terminal
81,142	SEGM <sub>1</sub> ,SEGM <sub>2</sub>	O	Icon segment driving signal output terminal

PAD No.	Symbol	I/O	F u n c t i o n
57	SEGS <sub>i</sub>	O	Static driving segment signal output terminal When power down mode V <sub>DD</sub> or V <sub>SS</sub> level are output.
10,9 8,7	C1 <sup>+</sup> C1 <sup>-</sup> C2 <sup>+</sup> , C2 <sup>-</sup>	I/O	Step up voltage capacitor connecting terminal
6	V <sub>SOUT</sub>	O	Step up voltage output terminal
13	V <sub>REG</sub>	O	Voltage regulator output terminal Connect the resistor between this terminal and VR terminal.
12	VR	I	Reference voltage for voltage regulator input terminal Connect the resistor between this reference voltage and V <sub>DD</sub> terminal.
16	<u>RESET</u>	I	Reset terminal When the "L" level input over than 1.2ms to this terminal, the system is reset (at f <sub>osc</sub> =180KHz).
15	SEL	I	Common and Segment driver location order select terminal. "0" Mode A location (See ■ PAD COORDINATES) "1" Mode B location (See ■ PAD COORDINATES)
14	TEST	I	Maker test terminal This terminal should be connected to V <sub>SS</sub> (or open.)
43 - 47 50 - 63 164 - 168	NC	-	Non connection terminal These terminals are electrically open.
169 49 1 48	ALI-A1 ALI-A2 ALI-B1 ALI-B2	-	Alignment mark These terminals are electrically open.

## ■ FUNCTIONAL DESCRIPTION

### (1) Description for each blocks

#### (1-1) Register

The NJU6475B incorporates three 8-bit registers, an instruction register (IR), and a Data Register (DR), Key Register (KR). The register (IR) stores an instruction code such as "clear display" and "cursor shift" or address data for Display Data RAM (DD RAM), Character Generator RAM (CG RAM) and Icon Display RAM (MK RAM). The MPU can write the instruction code and address data to the register (IR), but it cannot read out from register (IR). The Register (DR) is a temporary register, the data stored in the Register (DR) is written into DD RAM, MK RAM. A register from these two registers is selected by the register select signal (RS). Register (KR) is an only temporary register for key scan data. This Register (KR) can read out the contents when selected Key signal at "H" signal. And non relation ship with signal of register select (RS).

The Relation ship with RS, R/W register as shown below.

<Table-1> Register selection

RS	R/W	O p e r a t i o n
0	0	IR write & internal register operation mode (Clear Display etc...)
0	1	Read out (KR)
1	0	Write (DR) & internal register operation mode (DR→ DD RAM/CG RAM/MK RAM)
1	1	Read out (KR)

#### (1-2) Address Counter (AC)

The address counter (AC) addresses the DD RAM, CG RAM or MK RAM. When the address setting instruction is written into register (IR), the address information is transferred from register (IR) to the address counter (AC). The selection of DD RAM, CG RAM or MK RAM is also determined by this instruction.

After writing (or reading) the display data to (or from) the DD RAM, CG RAM or MK RAM, the address counter (AC) increments (or decrements) automatically.

#### (1-3) Display Data RAM (DD RAM)

The display data RAM (DD RAM) consisting of 48 x 8 bits stores up to 48-character display data represented in 8-bit code.

The DD RAM address data set in the address counter (AC) is represented in Hexadecimal code.

(Example) DD RAM Address "08"

## (1-3-1) The relation between DD RAM address and display position on the LCD

### -12-Characters 4-Line Display

	1	2	3	4	5	6	7	8	9	10	11	12	← Display Position
1st Line	00	01	02	03	04	05	06	07	08	09	0A	0B	← DD RAM Address (Hexadecimal)
2nd Line	10	11	12	13	14	15	16	17	18	19	1A	1B	
3rd Line	20	21	22	23	24	25	26	27	28	29	2A	2B	
4th Line	30	31	32	33	34	35	36	37	38	39	3A	3B	

When the display shift is performed, the DD RAM address changes as follows:

#### [Left shift display]

(00) ←	01	02	03	04	05	06	07	08	09	0A	0B	00
(10) ←	11	12	13	14	15	16	17	18	19	1A	1B	10
(20) ←	21	22	23	24	25	26	27	28	29	2A	2B	20
(30) ←	31	32	33	34	35	36	37	38	39	3A	3B	30

#### [Right shift display]

0B	00	01	02	03	04	05	06	07	08	09	0A	→ (0B)
1B	10	11	12	13	14	15	16	17	18	19	1A	→ (1B)
2B	20	21	22	23	24	25	26	27	28	29	2A	→ (2B)

## (1-4) Character Generator ROM (CG ROM)

The Character Generator ROM (CG ROM) stores 5 x 8 dots character pattern represented in 8-bit character code. The capacity is up to 252 kinds of 5 x 8 dots character pattern.

The correspondence between character code and standard character pattern of NJU6475B is shown in table 2.

User defined character patterns (Custom Font) are also available by mask option. (in this case, the address (20)<sub>H</sub> are using for "Space Pattern".)

<Table-2> The Correspondence Between Character Code  
and Standard Character Pattern (ROM Version -02)

# (1-5) Character Generator RAM (CG RAM)

The Character Generator RAM stores any kinds of character pattern in 5 x 8 dots written by the user program to display user's original character pattern. The CG RAM can store 4 kinds of character in 5 x 8 dots mode.

To display user's original character pattern stored in the CG RAM, the address data (00)<sub>H</sub>-(03)<sub>H</sub> should be written to the DD RAM as shown in Table-3.

<Table-3> Correspondence of CG RAM address, DD RAM character code and CG RAM character pattern (5 x 8 dots)

Character Code (DD RAM Data)	CG RAM Address	Character Pattern (CG RAM Data)
<div> <div>7 6 5 4 3 2 1 0</div> <div>← Upper Bits      Lower Bits →</div> </div>	<div> <div>7 6 5 4 3      2 1 0</div> <div>← Upper      Lower →</div> </div>	<div> <div>4 3 2 1 0</div> <div>← Upper      Lower →</div> </div>
0 0 0 0 0 0 0 0	0 1 0 0 0	<div> <div>1 1 1 1 0</div> <div>1 0 0 0 1</div> <div>1 0 0 0 1</div> <div>1 1 1 1 0</div> <div>1 0 1 0 0</div> <div>1 0 0 1 0</div> <div>1 0 0 0 1</div> <div>0 0 0 0 0</div> </div>

Character Pattern  
Example (1)

← Cursor Position

Character Pattern  
Example (2)

← Cursor Position

- Notes :
- Character code bit 0,1 correspond to the CG RAM address bit 3,4 (2bits ; 4patterns).
  - CG RAM address 0 to 2 designate character pattern line position. The 8th line should be "0".  
If there is "1" in the 8th line, but bit "1" is always displayed on the cursor position regardless of cursor existence.
  - Row position character pattern correspond to CG RAM data bits 0 to 4 are shown above.
  - CG RAM character patterns are selected when character code bits 2 to 7 are all "0" and these are addressed by character code bits "0" and "1".
  - "1" for CG RAM data corresponds to display on and "0" to display off.

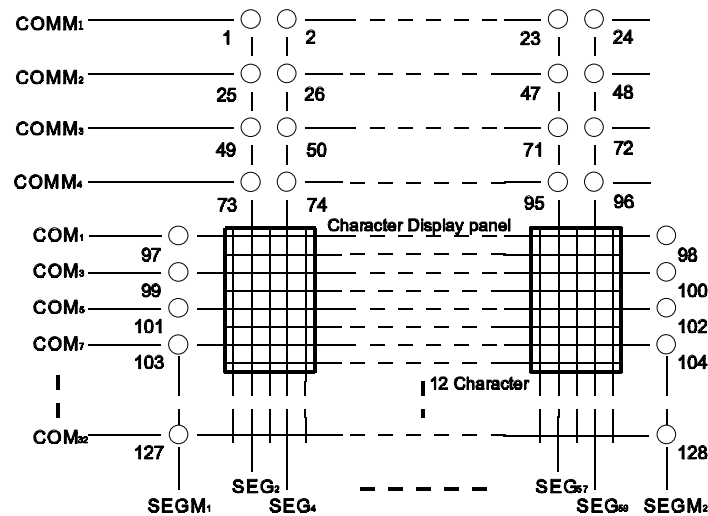

# NJU6475B

## (1-6) Icon display RAM (MK RAM)

The NJU6475B can display maximum 128 Icons.

The Icon display can be controlled by writing the data into MK RAM corresponding to the Icons.

The relation between MK RAM address and Icon display position is shown in Table-4.

<Table-4> Correspondence among Icon Position, MK RAM Address and Data

MK RAM Address (60 <sub>H</sub> - 7F <sub>H</sub> )		Bits for Icon Position MK RAM Address and Data							
		D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>

COMM<sub>1</sub> Line and  
Both besides of 1st Line  
(COM<sub>1</sub>, COM<sub>3</sub>, COM<sub>5</sub>, COM<sub>7</sub>)

COMM<sub>2</sub> Line and  
Both besides of 2nd Line  
(COM<sub>9</sub>, COM<sub>11</sub>, COM<sub>13</sub>, COM<sub>15</sub>)

COMM<sub>3</sub> Line and  
Both besides of 3rd Line  
(COM<sub>17</sub>, COM<sub>19</sub>, COM<sub>21</sub>, COM<sub>23</sub>)

COMM<sub>4</sub> Line and  
Both besides of 4th Line  
(COM<sub>25</sub>, COM<sub>27</sub>, COM<sub>29</sub>, COM<sub>31</sub>)

Notes : 1. When the Icon display function using, the system should be initialized by the software initialization Because the MK RAM is not initialized by the power on reset and hardware.

2. The cross-points between segments (SEGM<sub>1</sub> and SEGM<sub>2</sub>) and commons (COMM<sub>1</sub> to COMM<sub>4</sub> and COM<sub>2</sub> to COM<sub>32</sub>) are always set "OFF" level.

3. In the table 4, \* mark are invalid, therefore both of "0" or "1" can be written but these are no meaning.

## (1-7) Timing generator

The timing generator generates a timing signals for the DD RAM, CG RAM and MK RAM and other internal circuits. RAM and timing for the display and internal operation timing for MPU access are separately generated, so that may not interfere with each other.

Therefore, when the data write to the DD RAM for example, there will be undesirable influence, such as flickering, in areas other than display area.

## (1-8) LCD Driver

LCD Driver consists of 37-common driver and 63-segment driver. The character pattern data are latched to the addressed segment-register respectively.

This latched data controls display driver to output LCD driving waveform.

## (1-9) Cursor Blinking control circuit

This circuit controls cursor On / Off and cursor position character blinking. The cursor or blinking appear in the digit locating at the DD RAM address set in the address counter (AC). When the address counter is (08)<sub>H</sub>, a cursor position is shown as bellow.

	AC <sub>6</sub>	AC <sub>5</sub>	AC <sub>4</sub>	AC <sub>3</sub>	AC <sub>2</sub>	AC <sub>1</sub>	AC <sub>0</sub>
AC	0	0	0	1	0	0	0

## 4-Line Display

	1	2	3	4	5	6	7	8	9	10	11	12	← Display position
1st Line	00	01	02	03	04	05	06	07	<u>08</u>	09	0A	0B	← DD RAM Address (Hexadecimal)
2nd Line	10	11	12	13	14	15	16	17	18	19	1A	1B	
3rd Line	20	21	22	23	24	25	26	27	28	29	2A	2B	
4th Line	30	31	32	33	34	35	36	37	38	39	3A	3B	

↖  
Cursor position

Note : The cursor or blinking also appear when the address counter (AC) selects the CG RAM or the MK RAM. But the displayed cursor and blinking are meaningless.

If the AC stores the CG or MK RAM address data, the cursor and blinking are displayed in the meaningless position.

# NJU6475B

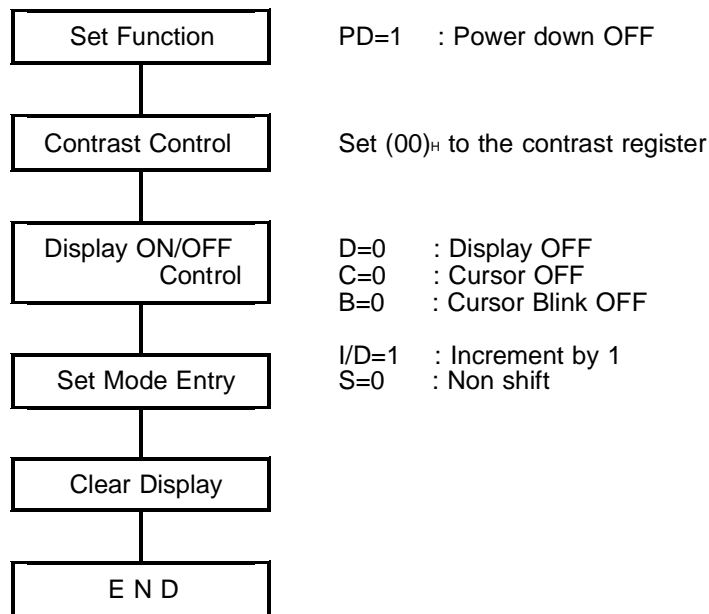

## (2) Power on Initialization by internal circuits

### (2-1) Internal Reset circuits Initialization

The NJU6475B is automatically initialized by internal power on initialization circuits when the power is turned on. In the internal power on initialization, following instructions are executed.

During the Internal power on initialization, the busy flag (BF) is "1" and this status is kept during 6ms ( $f_{osc}=180\text{KHz}$ ) after  $V_{DD}$  rose to 2.4V.

Initialization sequence

Note : If the condition of power supply rise time described in the Electrical Characteristics is not satisfied, the internal Power On Initialization will not performed.  
In this case, the software initialization by MPU is required.

### (2-2) Hardware Initialization

The NJU6475B prepares RESET terminal to initialize the all system.

When the "L" level is input over 1.2ms to the RESET terminal, reset sequence is executed. In this time, the busy signal is output during 6ms ( $f_{osc}=180\text{KHz}$ ) after RESET terminal went to "H".

-Timing Chart

### (3) Instruction

The NJU6475B incorporates two registers, an Instruction Register (IR) and a Data Register (DR). These two registers store control information temporarily to allow interface between NJU6475B and MPU or peripheral IC operating different cycles. The operation of NJU6475B is determined by this control signal from MPU.

The control information includes register selection signals (RS), Read / Write signals (R/W) and data signal (SIO).

<Table-5> shows each instruction and its operating time

Instruction	C o d e										Description	Execute Time (MAX) (f <sub>CP</sub> or f <sub>OSC</sub> =180kHz)

Note : If the oscillation frequency is changed, the execution time is also changed.

## (3-1) Description of each instructions

### (a) Maker Test

	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>
Code	0	0	0	0	0	0	0	0	0	0

### (b) Clear Display

	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>
Code	0	0	0	0	0	0	0	0	0	1

Clear Display Instruction is executed when the code "1" is written into DB<sub>0</sub>.

When this instruction is executed, the space code (20)<sub>H</sub> is written into every DD RAM address, then the DD RAM (00)<sub>H</sub> is set into address counter and I/D of entry mode is set as increment mode. If the cursor or blink are displayed, they are returned to the left end of the 1st line on the LCD panel.

In addition, S of entry mode is not changes and contents of MK RAM and CG RAM are also not changed.

Note : The character code (20)<sub>H</sub> must be blank code in the user defined character pattern (Custom font).

### (c) Return Home

	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>
Code	0	0	0	0	0	0	0	0	1	*

\*= Don't Care

Return Home instruction is executed when the code "1" is written into DB<sub>1</sub>.

When this instruction is executed, the DD RAM address (00)<sub>H</sub> is set into the address counter. Display is returned to its original position if shifted, the cursor or blink are returned to the left end of the 1st line on the LCD if the cursor or blink are operating. The DD RAM contents do not change.

### (d) Entry Mode Set

	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>
Code	0	0	0	0	0	0	0	1	I/D	S

Entry Mode Set instruction which sets the cursor moving direction and display shift On/Off, is executed when the code "1" is written into DB<sub>2</sub> and codes of (I/D) and (S) are written into DB<sub>1</sub> (I/D) and DB<sub>0</sub> (S). (I/D) sets the address increment or decrement, and the (S) sets the entire display shift at the DD RAM writing.

I/D	F u n c t i o n
1	Address increment : The address of the DD RAM or CG RAM increment (+1) when the read/write operation, and the cursor or blink moves to the right.
0	Address decrement : The address of the DD RAM or CG RAM decrement (-1) when the read/write operation, and the cursor or blink moves to the left.
S	F u n c t i o n
1	Entire display shift. The shift direction is determined by I/D. : shift to left at I/D=1 and shift to the right at the I/D=0. The shift is operated only for the character, so that it looks as if the cursor stands still and display moves. The display does not shift when reading from DD RAM and writing/reading into/from CG RAM.
0	The display does not shift.

## (e) Display ON/OFF Control

	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>
Code	0	0	0	0	0	0	1	D	C	B

Display ON/OFF control instruction which controls the whole display ON/OFF, the cursor ON/OFF and the cursor position character blink, is executed when the code "1" is written into DB<sub>3</sub> and codes of (D), (C) and (B) are written into DB<sub>2</sub> (D), DB<sub>1</sub> (C) and DB<sub>0</sub> (B), as shown below.

D	F u n c t i o n
1	Display On
0	Display Off. In this mode, the display data remains in the DD RAM so that it is retrieved immediately on the display when the D changes to 1.
C	F u n c t i o n
1	Cursor On. The cursor is displayed by 5 dots on the 8th line.
0	Cursor Off. Even if the display data write, the I/D etc does not change.
B	F u n c t i o n
1	The cursor position character is blinking. Blinking rate is 480ms at $f_{osc}=180KHz$ . The cursor and the blink can be displayed simultaneously.
0	The character does not blink.

Character Font 5x7 Dots

(1) Cursor Display Example

Alternating Display

(2) Brink Display Example

## (f) Cursor Display Shift

	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>	
Code	0	0	0	0	0	1	S/C	R/L	*	*	*= Don't Care

The cursor /display shift instruction shifts the cursor display to the right or left without writing or reading display data. This function is used to correct or search the display. The cursor moves to the 2nd line after the 12nd digit of the 1st line. Notice that 1st to 3rd line displays shift at the same time. When the displayed data are shifted repeatedly, each display moves in only same line. The 2nd and 3rd line display do not shift into the 1st and 2nd line.

The contents of address counter (AC) does not change by operation of only the display shift.

This instruction is executed when the code "1" is written into DB<sub>4</sub> and the codes of (S/C) and (R/L) are written into DB<sub>3</sub> (S/C) and DB<sub>2</sub> (R/L), as shown below.

S/C	R/L	F u n c t i o n
0	0	Shift the cursor position to the left ((AC) is decremented by 1).
0	1	Shift the cursor position to the right ((AC) is incremented by 1).
1	0	Shifts the entire display to the left and the cursor follows it.
1	1	shifts the entire display to the right and the cursor follows it.

(g) Function Set

	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>	
Code	0	0	0	0	1	*	*	*	*	PD	*= Don't Care

Function set instruction which sets the interface data length and power down is executed, when the code "1" is written into DB<sub>5</sub> and (PD) is written into DB<sub>0</sub>, as shown below.

When the power down mode is set, the display turns off automatically. Afterward, when the power down mode is reset, the display is off continuously.

The display appears by the display on instruction.

PD	F u n c t i o n
1	Power down mode off (Normal operation)
0	Power down mode on (the display goes to off automatically.)

(h) Set Electronic Volume Register

	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>	
Code	0	0	0	1	*	*	C <sub>3</sub>	C <sub>2</sub>	C <sub>1</sub>	C <sub>0</sub>	*= Don't Care
← Higher order bit —> <— Lower order bit —>											

Contrast Control instruction which adjusts the contrast of LCD, is executed when the code "1" is written into DB<sub>6</sub> and the codes of C<sub>0</sub> to C<sub>3</sub> are written into DB<sub>0</sub> to DB<sub>3</sub> as shown below.

The contrast of LCD can be adjusted one of 16 voltage stage by setting 4 bit register.

Set the binary code "0000" when contrast control unused.

C <sub>3</sub>	C <sub>2</sub>	C <sub>1</sub>	C <sub>0</sub>	V <sub>LCD</sub>
0	0	0	0	low
	:			
	:			
1	1	1	1	high

$V_{LCD} = V_{DD} - V_5$

(i) Set RAM Address

The RAM address set instruction is executed when the code "1" is written into DB<sub>7</sub> and the address is written into DB<sub>6</sub> to DB<sub>0</sub> as shown above.

The address data (DB<sub>6</sub> to DB<sub>0</sub>) is written into the address counter (AC) by this instruction.

After this instruction execution, the data writing/reading is performed into/from the addressed RAM.

The RAM includes DD RAM, CG RAM and MK RAM and these RAMs are shared by addressed as shown below.

RAM Address

DD RAM	1st Line	:	(00) <sub>H</sub>	to	(0B) <sub>H</sub>
DD RAM	2nd Line	:	(10) <sub>H</sub>	to	(1B) <sub>H</sub>
DD RAM	3rd Line	:	(20) <sub>H</sub>	to	(2B) <sub>H</sub>
DD RAM	4th Line	:	(30) <sub>H</sub>	to	(3B) <sub>H</sub>
CG RAM	4 Characters	:	(40) <sub>H</sub>	to	(5F) <sub>H</sub>
MK RAM	128 Icons	:	(60) <sub>H</sub>	to	(7F) <sub>H</sub>

(j) Write Data to CG, DD or MK RAM

-Write Data to DD RAM

-Write Data to CG or MK RAM

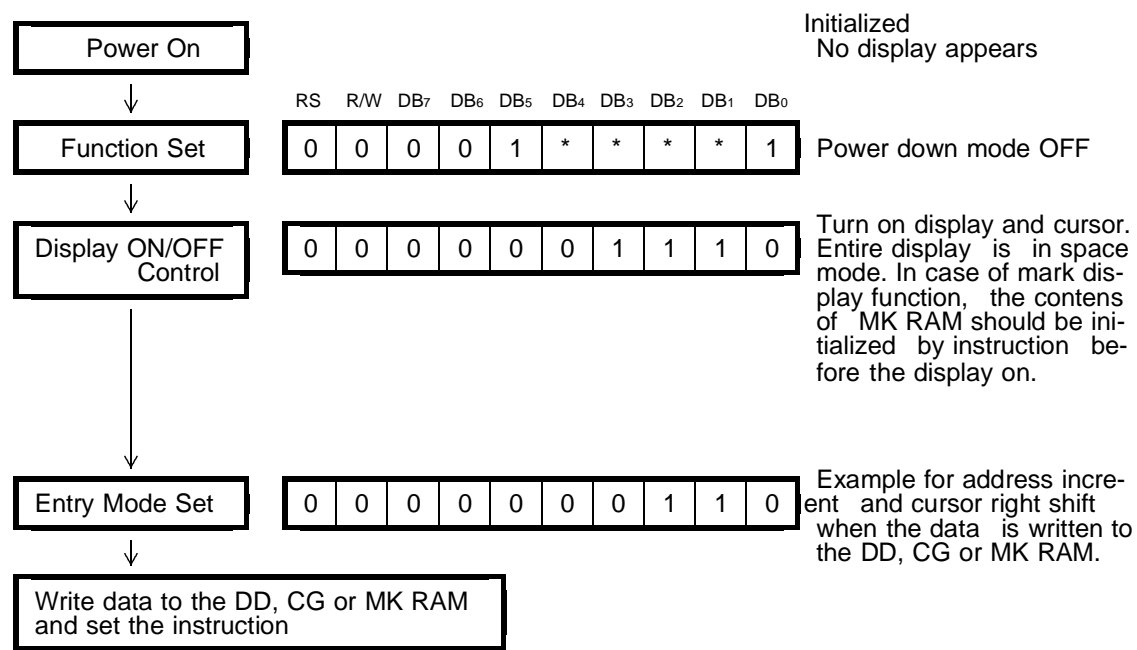

Write Data to RAM instruction is executed when the code "1" is written into (RS) and code "0" is written into (R/W).

By the execution of this instruction, the data is written into RAM. The selection of RAM is determined by the previous instruction.

After this instruction execution, the address increment (+1) or decrement (-1) is performed automatically according to the entry mode set.

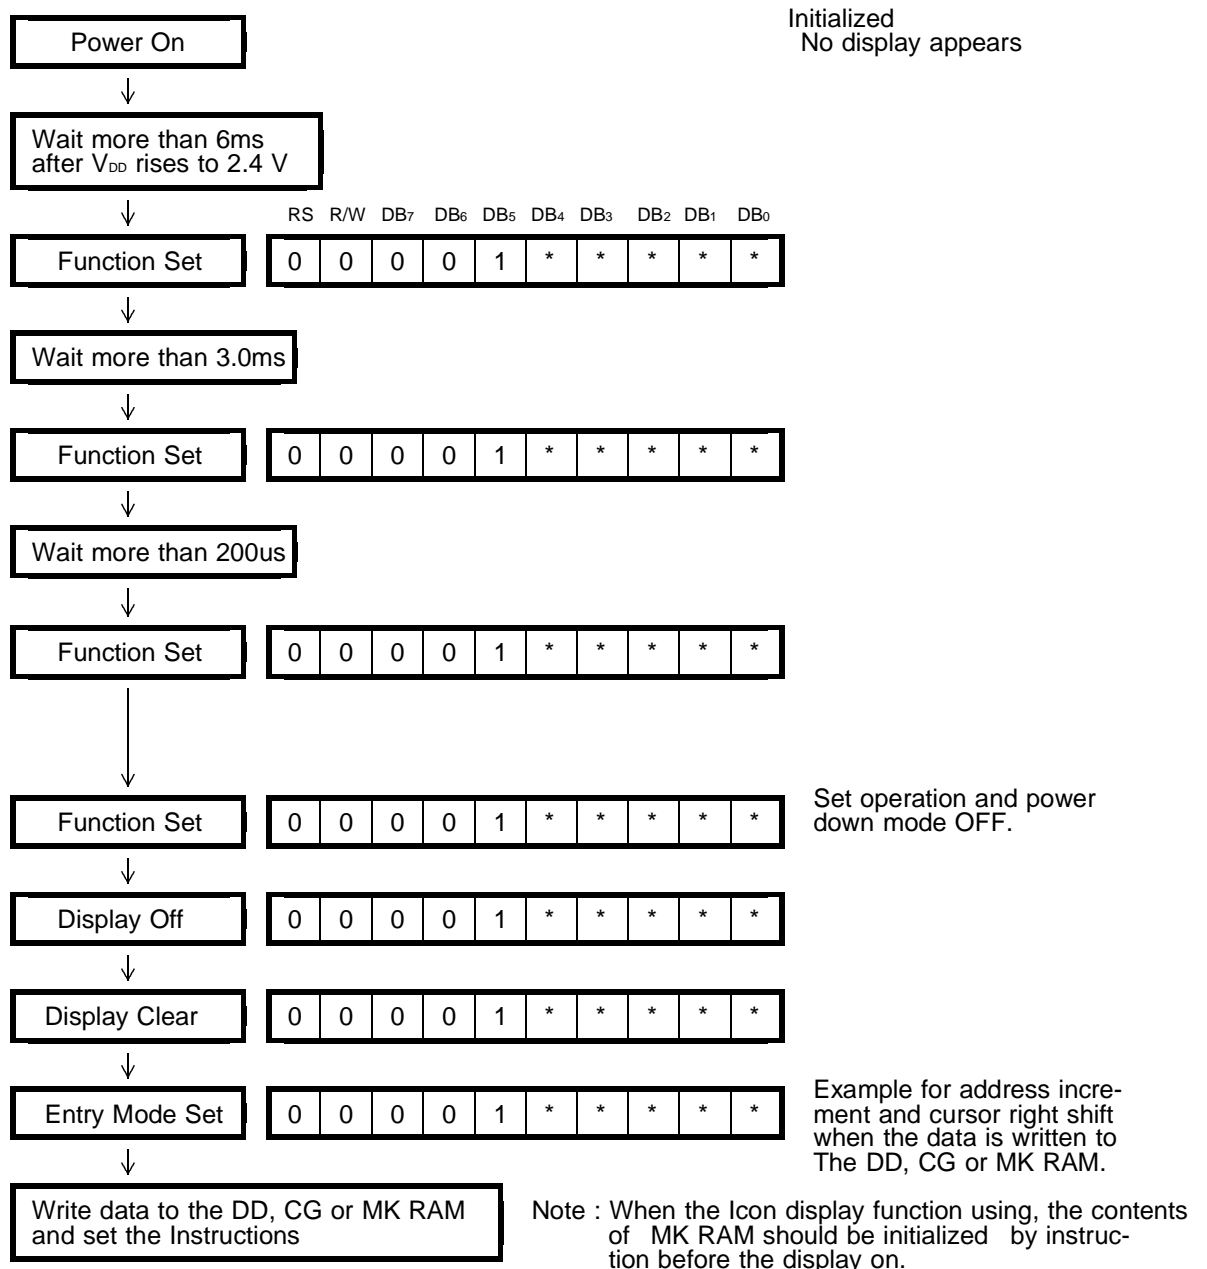

(3-2) Initialization using the internal reset circuit

When internal reset operates for initialization, the function set, Display ON/OFF Control and Entry Set instruction must be executed before the data input as shown below.

## (3-3) Initialization by instruction

If the power supply conditions for the correct operation of the internal reset circuits are not met, the NJU6475B must be initialized by instruction.

## (4) Power down Function

NJU6475B incorporates the power down mode to reduce the operating current.

The power down mode is set/reset by the function set instruction.

In the power down mode, all the character display and Icon display turn off and only static display operation is available.

The status of internal circuits at the power down mode is shown below.

- Main oscillator stops and sub oscillator for the static display starts the operation.
- Voltage converter, Key Scan, Voltage Regulator, Voltage follower (OP-AMP) are stopped.
- The contents of DD, CG, MK RAM are kept.

## (5) LCD Display

### (5-1) Power Supply for LCD Driving

NJU6475B incorporates voltage converter to generate the LCD driving voltage which is adjusted by the voltage regulator and the EVR.

#### (a) Voltage Converter

##### -Voltage Tripler

By connecting capacitor between  $C1^+$  and  $C1^-$ ,  $C2^+$  and  $C2^-$ ,  $V_{SS}$  and  $V_{5OUT}$  respectively, two times negative voltage of  $V_{DD}-V_{SS}$  output from  $V_{5OUT}$ .

##### -Voltage Doubler

By connecting capacitor between  $C2^+$  and  $C2^-$ ,  $V_{SS}$  and  $V_{5OUT}$  respectively, and connecting the  $C1^+$  terminal to  $C2^+$  terminal, and  $C1^-$  terminal being open, negative voltage of  $V_{DD}-V_{SS}$  output from  $V_{5OUT}$ .

Voltage Doubler

Voltage Tripler

#### (b) Voltage Regulator

Voltage Regulator incorporates a OP-AMP which is supplied  $V_{DD}$  and  $V_{5OUT}$ , and a reference voltage source ( $V_{REF}$ ).

By setting the VR level by connecting  $R_a$  and  $R_b$ , the regulator which amplifies  $V_{REF}$ , outputs the LCD driving voltage to the  $V_{REG}$  terminal.

Therefore the LCD driving voltage can be output between  $V_{DD}$  and  $V_{REG}$  by setting.

$$V_{REG} = (1 + R_b / R_a) V_{REF} \text{ in condition, } V_{DD} = 0V, |V_{REG}| < |V_{5OUT}|$$

The EVR functions  $V_{REF}$  value adjustment from 1st step to 16th by a step when the 4 bit data write into the EVR register by the instruction.

Set the EVR register to  $(00)_H$  when the EVR function is unused. Use variable resistances to external to the external resistances  $R_a$ ,  $R_b$  and thermistor if need due to the voltage reference  $V_{REF}$  is changed by the lot and operating temperature.

Take care the noise input on the VR terminal because of it is designed with high impedance. Short wiring should be required to avoid the noise input, if necessary.

## [ The Voltage Reference $V_{REF}$ Characteristics ]

Supply Voltage :  $V_{DD} = 0V$ ,  $V_{SS} = -3V$

Temperature : 25 °C

## [ The LCD Operating Voltage $V_{REG}$ Characteristics ]

Supply Voltage :  $V_{DD} = 0V$ ,  $V_{SS} = -3V$ ,  
External Resistances :  $R_a = 180K\Omega$ ,  $R_b = 820K\Omega$

Voltage Tripler Output :  $V_{SOUT} = -9V$   
Temperature : 25 °C

Used Formulation :  $V_{REG}(XX)_H = (1 + 820k\Omega/180k\Omega) V_{REF}(XX)_H$

# NJU6475B

## (c) Bleeder Resistance

Each LCD driving voltage ( $V_1, V_2, V_3, V_4, V_5$ ) is generated by the high impedance bleeder resistance buffered by voltage follower OP-AMP to get a enough display characteristics with low operating current. The bleeder resistance is set 1/7 bias suitable for 1/36 duty by  $5M\Omega$  resistance in total.

The capacitor connected between  $V_5$  and  $V_{DD}$  is needed for stabilizing  $V_5$ . The determination of the each capacitance of  $C_1, C_2$  and  $C_3$  generating for LCD operating voltage is required to operate with the LCD panel actually.

The capacitance for the typical application is shown below:

LCD Driving Voltage vs Duty

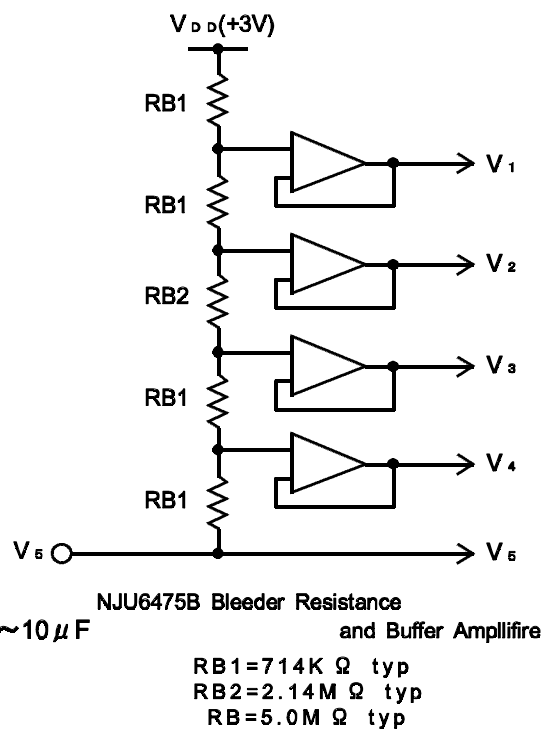

Power	Duty Ratio	1/36
Supply	Bias	1/7
$V_{LCD}$		$V_{DD} - V_5$

$V_{LCD}$  is the maximum amplitude for LCD driving voltage.

Typical capacitance :

$C1, C2, C3, C4 = 1.0 \sim 10 \mu F$

Typical application for LCD operating voltage generation

Note : Take care the noise into the  $VR$  terminal as designed with high impedance.  
Short wiring or sealed wiring are required to avoid the noise, if necessary.

## (5-2) Relation between oscillation frequency and LCD frame frequency

As the NJU6475B incorporates oscillation capacitor and resistor for CR oscillation, 180KHz oscillation is available without any external components. (1 Clock = 5.56us)

1/36 Duty

$$1 \text{ frame} = 5.56 \text{ (us)} \times 62 \times 36 = 12.4 \text{ (ms)}$$

$$\text{Frame frequency} = 1 / 12.4 \text{ (ms)} = 80.6 \text{ (Hz)}$$

# NJU6475B

## (6) Key Scan Circuit

### (6-1) Key scan timing chart

### (6-2) Key Scan

1. KEYCHECK signal always operates to check the status of keys excepting for power down mode.
2. When Key signal (K<sub>0</sub> to K<sub>3</sub>) 3 times detected continuously at rise up edge of KEYCHECK (inner side NJU6475), key Scan circuit performs output request signal (REQ terminal) rise to "H" and simultaneously key input information transmit to CPU. Its useful for anti-chattering. At the same time of REQ signal output, the key register status is "00010000 00000000" (Non Key Input) automatically. Key input terminal (K<sub>0</sub> to K<sub>3</sub>) are "H" in normal, then turn to "L" when Key input.

In case of request signal "H", When detects 3 times continuously key released status, request signal will be "L".

3. When the request signal is detected, CPU should be LCD / KEY to "H" and read out key data by instruction. 16-bit key data synchronizing to "SCL" (SCL terminal) is read out to CPU.  
 (1st time output key data was fixed as "00010000 00000000")  
 keyscan operation start from the next rising edge of SCL after the end of key data read out operation.

Fig. 3

4. The key data are gotten from 4 terminals ( $K_0$  to  $K_3$ ) at each timing of key scan signals ( $S_0$  to  $S_7$ ).  
 The detected data are up dating anytime and stores to key register.

- Key scan timing : 0.45ms (fosc = 180KHz, MAX = 0.64ms)
- Pulth width : 45us (fosc = 180KHz, MAX = 64us)

# NJU6475B

## (6-3) Key scanning timing

Key status is gotten at 3/4 port timing of  $t_{kp}$  during "L" period of  $S_0$  to  $S_7$ .

## (6-4) The format of detection

1st Byte

Fix

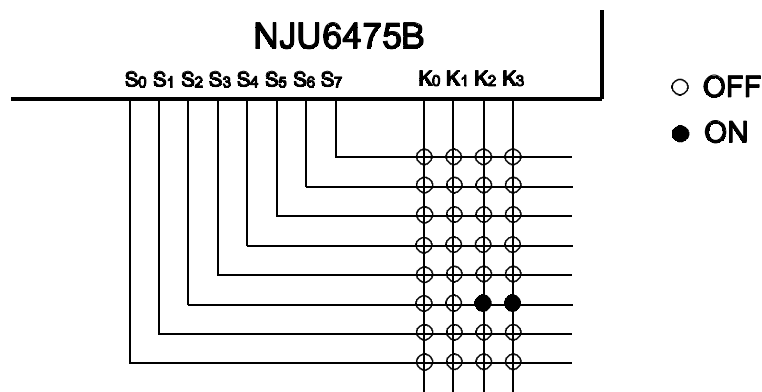

$K_{L3}$  to  $K_{L0}$  : Corresponds to  $K_3$  to  $K_0$

2nd Byte

$K_{H7}$  to  $K_{H0}$  : Corresponds to  $S_7$  to  $S_0$

( For Example )

1st Byte

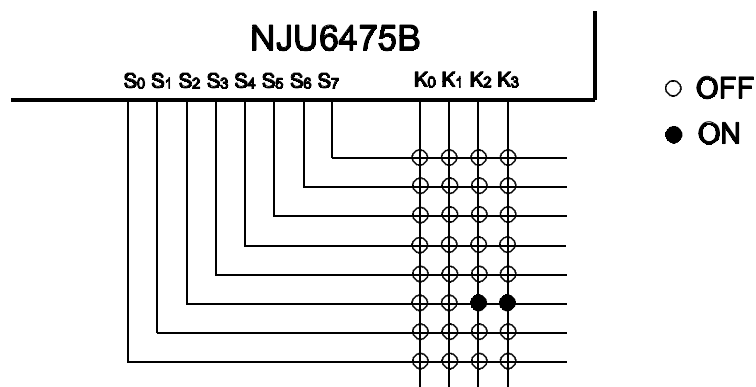

2nd Byte

## (6-5) Key roll over input

NJU6475B can be accepted the key roll over input.  
In case of key roll over input, the output results are shown below;

-Connecting same  $S_x$  signal line at multiple key push.

When key-in shown above case, the data contents are "00011100" "00000100".

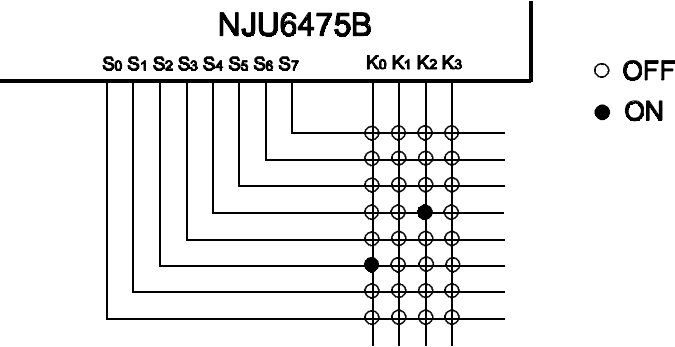

-The case of connecting different  $S_x$  signal line at multiple key push (1)

When key-in shown above case, the data contents are "00010100" "00010100".

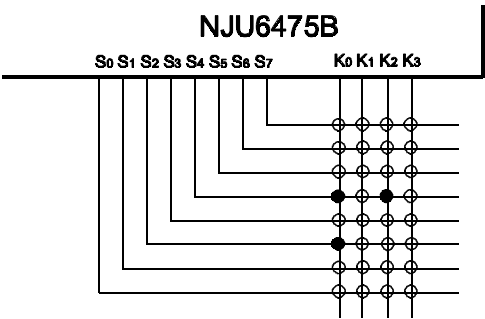

# NJU6475B

-The case of connecting different S<sub>x</sub> signal line at multiple key push (2)

When key-in like as shown above, the data contents are "00010101" "00010100".  
In this case, the result will be same, at each key-in shown below.

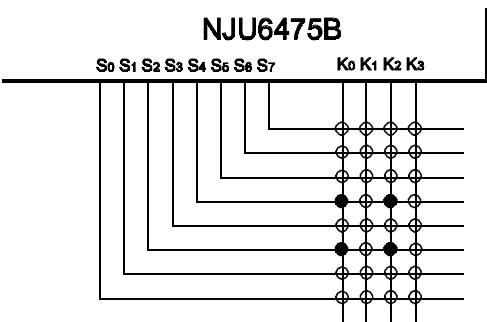

[Case 1]

[Case 2]

[Case 3]

[Case 4]

[Case 5]

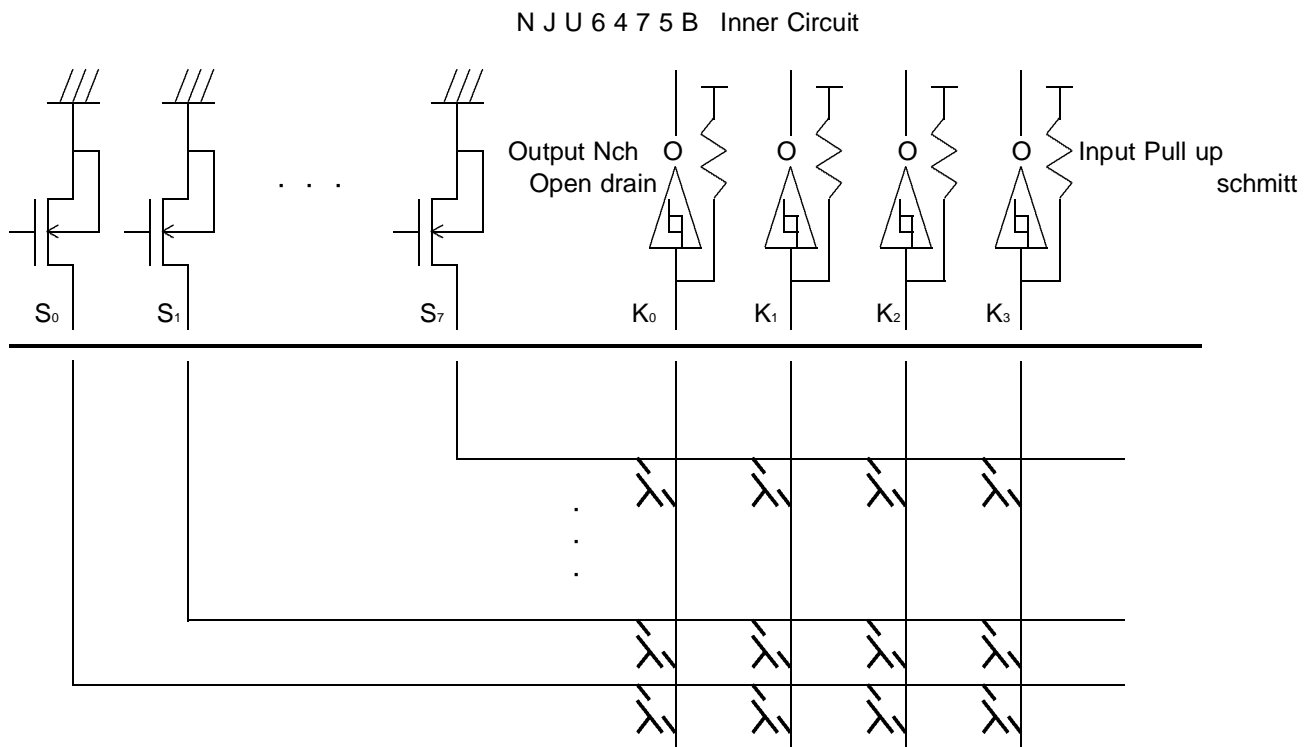

[Case 6]

## (6-6) The inner composition of Key Scan circuit

The inner composition of key scan circuit shown below :

-In case of non input the key each terminal status shown below:

S<sub>0</sub> to S<sub>7</sub> : The status of Nch FET output side is ON, output result is "L".

K<sub>0</sub> to K<sub>3</sub> : The status is "H" by pull-up resistance.

-When any key key-in, K<sub>x</sub> of key-in side turn to "L" and it can confirms.

-Input terminal (K<sub>0</sub> to K<sub>3</sub>) are composed by schmitt inverter input method.

# NJU6475B

---

## (7) Interface with MPU

Interface circuit of NJU6475B can be connected to serial by turn to "L" P/S terminal on shown below serial data timing. And DB<sub>0</sub> to DB<sub>5</sub> can be use to output port.

Notes : RS, R/W, LCD/KEY requires setting before CS fall down.  
RS is unrelated to read out of key data and writing of port data.

Serial interface circuit is in operation at CS is "L".  
When SCL rises, input data was lead, and rises CS case loading input data.  
When the input data was less than 16 bits, input data will be invalid at rises CS. And so on equal or over than 16 bits case, rear side total 16 bits are effectiveness. The input data should be total 16 bits.  
The data of read/write are composed MSB first.

# -Data format

The data formatted by 2 byte form at read/write.

When writing data consists LCD data and port data.

The using data in write mode means one of key data.

In write mode of data format, 1st byte means recognition data of LCD data and Port data.

In "0110 0000" (fixed) selects LCD data, in "0110 0001" (fixed) selects Port data.

The data of 2nd byte consists each data contents.

When the 1st byte of MSB 4 bit data are not "0110", in this case the input data will be invalid.

## ■ MAXIMUM ABSOLUTE RATINGS

P A R A M E T E R	SYMBOL	R A T I N G S	UNIT	N O T E
Supply Voltage (1)	$V_{DD}$	- 0.3 ~ + 7.0	V	
Input Voltage	$V_i$	- 0.3 ~ $V_{DD} + 0.3$	V	
Operating Temperature	$T_{opr}$	- 30 ~ + 80	°C	
Storage Temperature	$T_{stg}$	- 55 ~ + 125	°C	

Note-1 : If the LSI are used on condition above the absolute maximum ratings, the LSI may be destroyed. Using the LSI within electrical characteristics is strongly recommended for normal operation. Use beyond the electric characteristics conditions will cause malfunction and poor reliability.

Note-2 : Decoupling capacitor should be connected between  $V_{DD}$  and  $V_{SS}$  due to the stabilized operation for the voltage converter.

Note-3 : All voltage value are specified as  $V_{SS} = 0V$ .

The relation :  $V_{DD} > V_{SS}$ ,  $V_{DD} > V_{SS} \geq V_{5out}$ ,  $V_{SS} = 0V$  must be maintained.

# NJU6475B

Note-4 : Input/Output structure except LCD display are as shown below.

## -Input terminal structure

(without pull-up MOS)  
Applicated terminals : E/SCL, RS,  
R/W, P/S, SEL, RESET, LCD/KEY

(Pull-up with MOS, schmitt)  
 $K_0 \sim K_3$

(Pull down MOS)  
TEST

## -Input terminals structure

Applicated terminal : OSC1

## -Common terminals

Input/Output structure.

Applicated terminal  
:  $DB_7$  to  $DB_0$

Note-5 : Apply to the output and Input/Output Terminals.

Note-6 : Except current of pull-up MOS and output drive MOS.

Note-7 : Except Input/Output part current but including the current on bleeder resistance.

If the input level is medium, current consumption will increase due to penetration current.  
therefore, the input level must be fixed to "H" or "L".

## -Operating Current Measurement Circuit

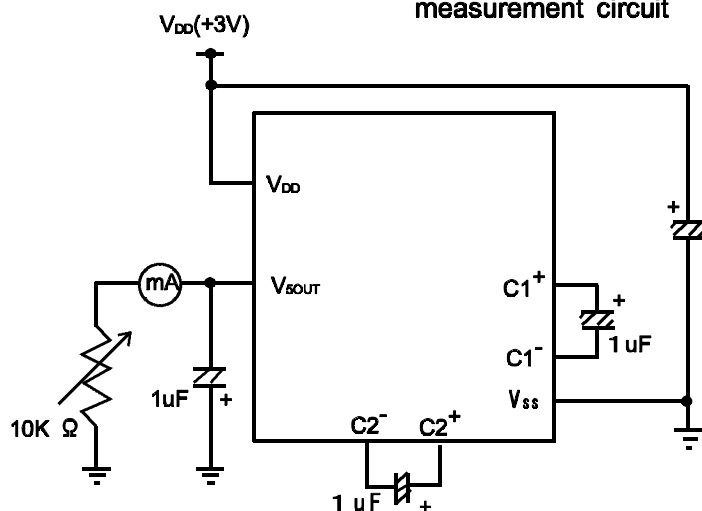

Note-8 :  $R_{com}$  and  $R_{seg}$  are the resistance values between power supply terminals ( $V_{DD}$ ,  $V_{SOUT}$ ) and each common terminal ( $Com_1$  to  $Com_{32}$  /  $COMM_1$  to  $COMM_4$ ) and Supply voltage ( $V_{DD}$ ,  $V_{SOUT}$ ) and each segment terminal ( $SEG_1$  to  $SEG_{60}$  /  $SEGM_1$  to  $SEGM_2$ ) respectively, and measured when the current  $I_d$  is flown on every common and segment terminals at same time.

Note-9 : Apply to the voltage from each COM and SEG are less than  $\pm 0.15V$  against the LCD driving contrast voltage ( $V_{DD}$ ,  $V_{SOUT}$ ) at no load condition.
