

## 128-common x 128-segment 4-level Gray Scale BITMAP LCD DRIVER

### ■ GENERAL DESCRIPTION

The **NJU6680** is a 128-common x 128-segment 4-level gray scale bit map LCD driver to display graphics or characters.

It contains 32,768-bit display data RAM, microprocessor interface circuits, instruction decoder, and common and segment drivers.

An image data from CPU through the serial or 8-bit parallel interface are stored into the 32,768-bit internal display data RAM and are displayed on the LCD panel through the commons and segments drivers.

The **NJU6680** features 4-level gray scale display function creating 4 types of gray scale (white / light gray / dark gray / black) and black & white display function.

The **NJU6680** contains a built-in OSC circuit for reducing external components. And it features Partial Display Function containing selectable active display block and optimizing the duty cycle ratio. This function dramatically reduces the operating current, setting the optimum boosted voltage combined with a programmable voltage booster circuit and an electrical variable resistor. As result, it reduces the operating current.

The operating voltage from 2.2V to 3.6V and low operating current are suitable for small size battery operation items.

### ■ PACKAGE OUTLINE

NJU6680CL

### ■ FEATURES

- Direct Correspondence of Display Data RAM to LCD Pixel
- Display Method – 4-level Gray Scale / Black & White
- Display Data RAM – 32,768 bits ;( 128-Com x 128-Seg) x 2bit
- LCD drivers – 128-common and 128-segment
- Direct connection to 8-bit Microprocessor interface for both of 68 and 80 type MPU
- Serial Interface (SI, SCL, RS,  $\overline{CS}$ )
- Partial Display Function
- Easy Vertical Scroll by setting the start line address of over size display data RAM
- Programmable Bias ratio selection ; 1/5, 1/6, 1/7, 1/8, 1/9, 1/10, 1/11, 1/12 bias
- Useful Instruction Sets  
Status read, Display data write, Column address set, Page address set, Initial display line set, Initial COM<sub>0</sub> line set, Display ON/OFF, Entire display ON/OFF, Reverse display ON/OFF, N-line inversion set, N-line inversion OFF, ADC select, COM scan direction select, Internal resistor ratio set, Power control set, Partial display duty set, LCD bias set, Boost level set, Contrast level set, Power save mode ON, Power save mode OFF, Internal oscillator ON, Display data length set, Reset, FRC & PWM set, Grey scale mode set Display mode set.
- Power Supply Circuit for LCD; Programmable Booster Circuits (6 times maximum, Voltage boosting polarity : Positive Voltage ( $V_{SS}$  Common), Voltage Regulator, Voltage Follower (x 4))
- Precision Electrical Variable Resistance (64 Step)
- Low Operating Current  $I_{OUT1}=400\mu A$  (TYP.)
- Operating Voltage 2.2 to 3.6 V
- LCD Driving Voltage 6.0 to 18.0V
- Package Outline Bumped Chip
- C-MOS Technology ( Substrate : P )

# NJU6680

## PAD LOCATION

Chip Center	:X=0μm,Y=0μm
Chip Size	:X=13.11m,Y=3.08mm
Chip Thickness	:675μm +/- 30um
Bump Size	:40μm x 83μm
Pad Pitch	:60μm (min)
Bump Height	:15μm (typ)
Bump Material	:Au
Voltage boosting polarity :	
Positive Voltage (V <sub>SS</sub> Common)	
Substrate	: P

## • MPU Interface Circuits

No.	Terminal	Description
26	PS <sub>0</sub>	Parallel or serial interface select terminal PS <sub>0</sub> ="L", PS <sub>1</sub> ="L": 3-line serial PS <sub>0</sub> ="L", PS <sub>1</sub> ="H": 4-line serial PS <sub>0</sub> ="H", PS <sub>1</sub> ="L": 80 type MPU parallel interface PS <sub>0</sub> ="H", PS <sub>1</sub> ="H": 68 type MPU parallel interface
30	PS <sub>1</sub>	
34	$\overline{CS}$	Chip select terminal Active "L"
56-49	D <sub>7</sub> -D <sub>0</sub>	Data bus terminals Parallel interface: D <sub>7</sub> to D <sub>0</sub> Serial interface: SI (D <sub>7</sub> terminal), SCL (D <sub>6</sub> terminal)
39	RS	Register select terminal • This signal distinguishes instruction data or display data when the LSI is used in the 4-line serial or parallel interface mode. RS="H": D <sub>7</sub> to D <sub>0</sub> are Display data RS="L": D <sub>7</sub> to D <sub>0</sub> are Instruction data
44	E (RD)	68 type MPU: Active "H" 80 type MPU: Active "L"
40	R/W (WR)	68 type MPU: R/W="H": Read operation R/W="L": Write operation 80 type MPU: Active "L"
35	$\overline{RES}$	Reset terminal Active "L"
88	OSC <sub>1</sub>	OSC terminal • When the internal oscillator is used, the external resistor, R <sub>f</sub> , is required between this terminal and the V <sub>DD</sub> . R <sub>f</sub> =270kΩ: Frame frequency=165Hz (typ.)

## • LCD drivers

No.	Terminal	Description
182-155, 138-103, 311-338, 355-390	COM <sub>0</sub> -- COM <sub>127</sub>	Common (row) drivers COM <sub>0</sub> -COM <sub>127</sub>
182-310	SEG <sub>0</sub> -- SEG <sub>127</sub>	Segment (column) drivers SEG <sub>0</sub> -SEG <sub>127</sub>

## • Dummy

No.	Terminal	Description
1-18, 89-98, 100,102 139-154, 339-354, 391,393	DUMMY <sub>1</sub> -- DUMMY <sub>64</sub>	No connections. Dummy pads

## • Test terminals

No.	Terminal	Description
22,99, 101,392, 394	TEST <sub>1</sub> -- TEST <sub>5</sub>	No connections. Used for maker test

## ■ Functional Description

### (1) Description of each blocks

#### (1-1) Busy Flag (BF)

The BF is used to indicate whether the LSI is busy or not. During the busy status, the LSI cannot accept any instruction except the "Status read" instruction, which reads out the BF through the D<sub>7</sub> terminal. When the cycle time (tcyc) mentioned in "AC characteristics" is satisfied, the BF is not required after each instruction so that it is possible to improve the process performance of an MPU.

#### (1-2) Initial display line register

The initial display line register is used to specify the DDRAM line address corresponding to the COM<sub>0</sub> by the "Initial display line set" instruction. It is used not only for normal display but also vertical scrolling and page switching displays without changing the display data in the DDRAM.

#### (1-3) Line Counter

The line counter is used to provide the DDRAM line address. The line address is initialized whenever the polarity of an internal frame signal (FR) is switched, and then it is counted up in synchronization of a common timing signal.

#### (1-4) Column Address Counter

An MPU can access only 7-bit [C6:C0] "column address" by the "Column address LSB set" and "Column address MSB set" instructions. When both 4-bit LSB and 3-bit MSB data is set into the column address register, 8-bit "internal column address" is established in the LSI as illustrated in the following figure, and accordingly, 2-bit display data must be written for each pixel with two successive bytes.

The column address automatically increases by 1 (+1) after each 2-byte display data and wraps around to the column address (00)<sub>H</sub> in the same page after the last column is addressed. The assignment of the column address for the segment drivers can be reversed by the "ADC set" instruction.

Segment outputs	SEG <sub>0</sub>	SEG <sub>1</sub>	SEG <sub>2</sub>	SEG <sub>3</sub>	....	SEG <sub>124</sub>	SEG <sub>125</sub>	SEG <sub>126</sub>	SEG <sub>127</sub>
Internal Column address	(00) <sub>H</sub>   (01) <sub>H</sub>	(02) <sub>H</sub>   (03) <sub>H</sub>	(04) <sub>H</sub>   (05) <sub>H</sub>	(06) <sub>H</sub>   (07) <sub>H</sub>	....	(F8) <sub>H</sub>   (F9) <sub>H</sub>	(FA) <sub>H</sub>   (FB) <sub>H</sub>	(FC) <sub>H</sub>   (FD) <sub>H</sub>	(FE) <sub>H</sub>   (FF) <sub>H</sub>
Column address (ADC=0)	(00) <sub>H</sub>	(01) <sub>H</sub>	(02) <sub>H</sub>	(03) <sub>H</sub>	....	(7C) <sub>H</sub>	(7D) <sub>H</sub>	(7E) <sub>H</sub>	(7F) <sub>H</sub>
Display data	1   1	0   0	0   1	1   0	....	0   1	1   0	1   1	0   0
Display image					....				

Column address (ADC=1)	(7F) <sub>H</sub>	(7E) <sub>H</sub>	(7D) <sub>H</sub>	(7C) <sub>H</sub>	....	(03) <sub>H</sub>	(02) <sub>H</sub>	(01) <sub>H</sub>	(00) <sub>H</sub>
Display data	0   0	1   1	1   0	0   1	....	1   0	0   1	0   0	1   1
Display image					....				

#### (1-5) Page Address Register

The page address register is used to provide the DD RAM page address.

#### (1-6) Display data RAM (DD RAM)

The Display data RAM (DD RAM) is the bit map RAM consisting of 32,768-bit to store the display data corresponding to 128x128 pixels on LCD panel. Each LCD pixel corresponds to two bits in the display data RAM in gray scale mode and to one bit in black & white mode, display data respectively.

The DD RAM data : "00" = Gray Scale Level 0 ( Set by the "Gray Scale Level Select" instruction)  
 The DD RAM data : "01" = Gray Scale Level 1 ( " )  
 The DD RAM data : "10" = Gray Scale Level 2 ( " )  
 The DD RAM data : "11" = Gray Scale Level 3 ( " )

The DD RAM data and the state of the LCD in Black & White Mode:

In Normal Display : "1"=Turn-On Display, "0"=Turn-Off Display

In Reverse Display : "1"=Turn-Off Display, "0"=Turn-On Display

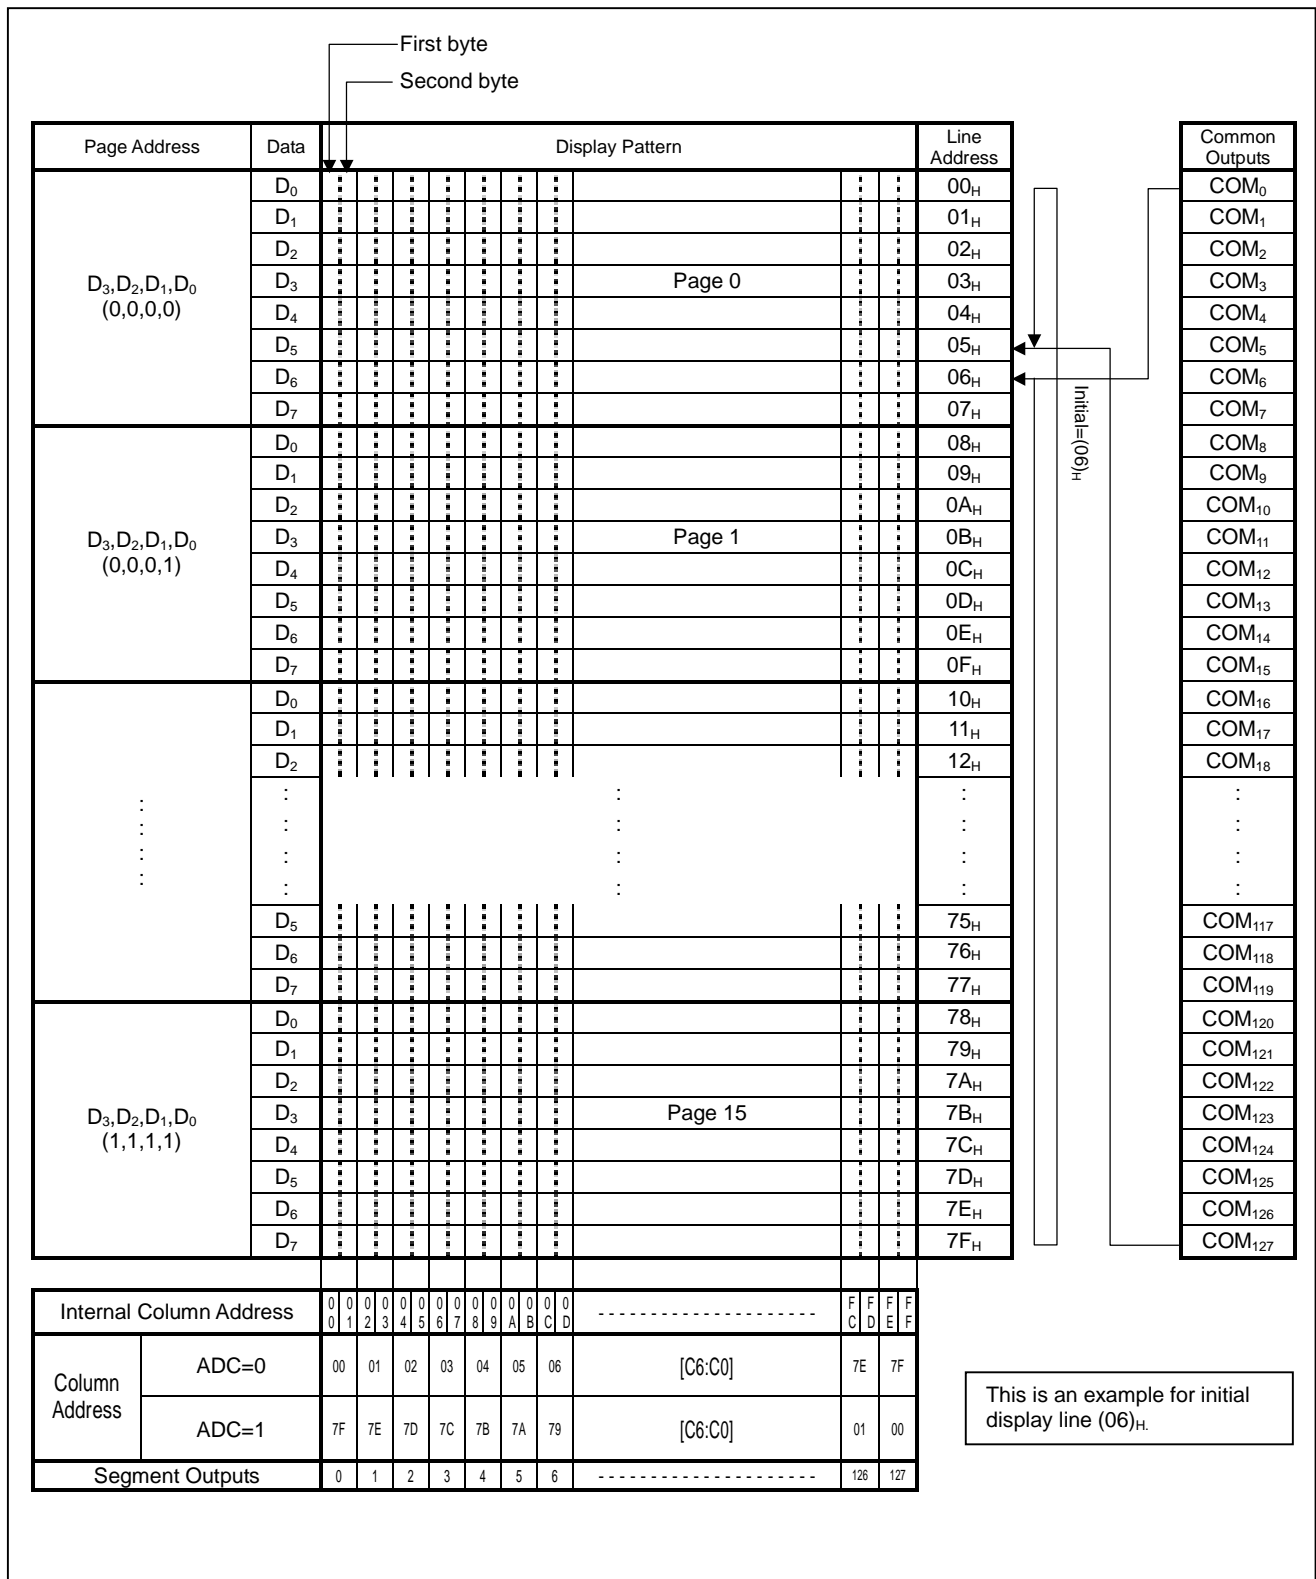

Fig.1 Display data RAM (DDRAM) Map

## (1-7) Common Direction Register

The common direction register is used to select a common scan direction by setting the  $S_0$  in the "COM scan direction select" instruction.

$S_0$	COM scan direction
0	COM <sub>0</sub> to COM <sub>127</sub>
1	COM <sub>127</sub> to COM <sub>0</sub>

## (1-8) Reset Circuit

The reset circuit is used to initialize the LSI to the following default status by setting the  $\overline{RES}$  terminal to "0" level.

Default status by using of the  $\overline{RES}$  terminal

1. Page address : (0) page
2. Column address : (00)<sub>H</sub>
3. COM scan direction :  $S_0=0$
4. ADC select :  $S_0=0$
5. Initial display line : (00)<sub>H</sub>
6. Initial COM0 line : (00)<sub>H</sub>
7. Display ON/OFF : OFF
8. Reverse display ON/OFF : OFF
9. Entire display ON/OFF : OFF
10. N-line inversion ON/OFF : OFF
11. Partial display duty ratio : 1/128 duty
12. Power control register : (VC,VR,VF)=(0,0,0)
13. Boost level : 3x boost
14. Contrast level : 32 level
15. LCD bias : 1/12 bias
16. Internal resistor ratio :  $1+R_b/R_a=2.3$
17. Internal oscillator ON/OFF : OFF
18. Power save mode ON/OFF : OFF
19. Display data length : (0,0,0,0)
20. White mode set : OFF
21. White palette register : (0,0,0,0)
22. Light gray mode set : OFF
23. Light gray palette register : (0,0,0,0)
24. Dark gray mode set : OFF
25. Dark gray palette register : (1,1,1,1)
26. Black mode set : OFF
27. Black palette register : (1,1,1,1)
28. FRC & PWM mode : 4-frame, 9-level
29. Display mode set : Gray scale mode

The  $\overline{RES}$  terminal is usually connected to the MPU's reset terminal in order that the LSI is initialized at the same timing of the MPU reset. The reset time must be at least 10us or longer, as mentioned in "DC characteristics". The LSI will return to normal operation after about 1us from the rising edge of the rest signal. In case that an external power supply is used for the LCD driving voltage, the  $\overline{RES}$  terminal is required to be maintained in the "0" level when the external power supply is turned on.

The "Reset" instruction in Table 3 cannot be substituted for the reset operation by the  $\overline{RES}$  terminal. It can execute only 1,2,5,14,16,19 to 28 items listed above.

(1-9) LCD display circuits

(a) Common and segment drivers

The common and segment drivers are used to generate LCD driving waveforms in accordance with the combination of display data, common timing signal (CL) and internal frame signal (FL).

(b) Display timing generator

The display timing generator is used to generate the common timing signal (CL) and the internal frame signal (FR). The FR signal adopts the 2-frame AC driving method, in which the FR signal is toggled to alternate the crystal polarization on an LCD panel. It toggles on every frame in the default setting or once every N frames in the N-line inversion mode setting, as illustrated in Fig.2-1 and Fig.2-2.

(c) Display Data Latch Circuit

The display data latch circuit is used to temporally store the 128-bit display data transferred from the DDRAM and output these display data onto the segment drivers in synchronization of the CL signal. The output timing for the display data, from display latch circuits to segment drivers, is independent of the access timing from MPU to DDRAM. As a result, the LCD display is not affected by the DDRAM access.

The “Display ON/OFF”, “Reverse display ON/OFF” and “Entire display ON/OFF” instructions control the display data in the display data latch circuit, however they do not change the display data in the DDRAM.

Fig.2-1 LCD driving Waveforms

Fig. 2-2. LCD driving waveforms in the n-line inversion mode

## (d) Oscillator

The internal oscillator is used to create internal clocks for the display timing signals (CL, FR) and the voltage converter.

(e) Internal Power Circuits

The internal power circuits are composed of the voltage converter, voltage regulator with 64-level EVR, and voltage followers. The status of the internal power circuits is arranged by the "Power control set" instruction, as shown in Table 1. For this arrangement, the part of the internal power circuits can be used in combination with an external power supply, as shown in Table 2.

The internal power circuits require the optimum values for the passive components, such as  $V_0$  to  $V_4$  capacitors and external feedback resistors in accordance with an LCD panel; and accordingly should be evaluated by using of actual LCD module samples to decide these values.

Table 1. Power control set

Bits	Portions	Status	
VC	Voltage converter	1: ON	0: OFF
VR	Voltage regulator	1: ON	0: OFF
VF	Voltage followers	1: ON	0: OFF

Table 2. Power supply combinations

Combination	Instruction			Power supply circuits			Output terminals		
	VC	VR	VF	Voltage converter	Voltage regulator	Voltage followers	$V_{OUT}$	$V_0$	$V_1-V_4$
Using all internal power circuits	1	1	1	ON	ON	ON	Open	Open	Open
Using voltage regulator and voltage followers	0	1	1	OFF	ON	ON	External	Open	Open
Using voltage followers	0	0	1	OFF	OFF	ON	Open	External	Open
Using only external power Supply	0	0	0	OFF	OFF	OFF	Open	External	External

Note) De coupling capacitors on the  $V_0$  to  $V_4$  terminals are required when the voltage followers are enabled.

● Power Supply Circuits example

Fig. 3. Power circuits configuration

## (2) Instructions

The **NJU6680** distinguishes the data on the data bus D<sub>0</sub> to D<sub>7</sub> as an instruction by combination of RS and R/W signals. The decoding of the instruction and execution performs with only high speed internal timing without relation to the external clock.

In case of the serial interface, the data input as MSB(D<sub>7</sub>) first serially.

Table.3-1, 3-2 shows the instruction codes of the **NJU6680**

Table 3-1. Instruction Codes

Instruction		Code										Descriptions
		RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>

## (2-1) Descriptions of the Instruction Codes

### (a) Status read

The “Status read” instruction is used to read out an LSI internal status. It is available only in the parallel interface mode.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	1	BUSY	ON	RES	0	0	0	0	0

**BUSY**      0: The LSI is idle.  
                  1: The LSI is busy and cannot accept any instruction except the “Status read”.

**ON**          0: Display OFF  
                  1: Display ON

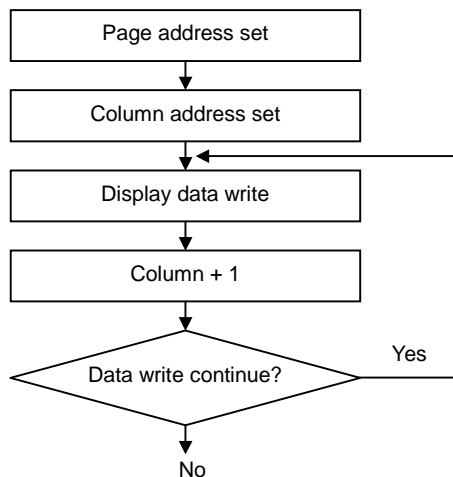

**RES**        0: The LSI is idle.  
                  1: The LSI is executing the reset operation.

### (b) Display data write

The “Display data write” instruction is used to write display data into the DDRAM, which address is designated by the “Column address set” and “Page address set” instructions. The column address automatically increases by 1 (+1) after each 2-byte display data and wraps around to the column address 00<sub>H</sub> in the same page after the last column is addressed. In case that the LSI is used in the 3-line serial interface mode, the “Display data length set” instruction is required before the “Display data write” instruction.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
1	0	Display data							

Sequence for the display data writing

## (c) Column address set

The “Column address set” instruction is used to specify the column address for display data. It is required before the “Display data write” instruction. An MPU can access only 7-bit [C6:C0] “column address” by the “Column address LSB set” and “Column address MSB set” instructions. When both 4-bit LSB and 3-bit MSB data is set into the column address register, 8-bit “internal column address” is established in the LSI. For this reason, 2-bit display data must be written for each pixel with two successive bytes.

The column address automatically increases by 1 (+1) after each 2-byte display data and wraps around to the column address 00<sub>H</sub> in the same page after the last column is addressed, and therefore, the DDRAM can be continuously accessed without another “Column address set” instruction.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	
0	0	0	0	0	0	C <sub>3</sub>	C <sub>2</sub>	C <sub>1</sub>	C <sub>0</sub>	LSB column address
0	0	0	0	0	1	0	C <sub>6</sub>	C <sub>5</sub>	C <sub>4</sub>	MSB column address

C <sub>6</sub>	C <sub>5</sub>	C <sub>4</sub>	C <sub>3</sub>	C <sub>2</sub>	C <sub>1</sub>	C <sub>0</sub>	Column address	Internal Column address
0	0	0	0	0	0	0	00 <sub>H</sub>	00 <sub>H</sub>
								01 <sub>H</sub>
0	0	0	0	0	0	1	01 <sub>H</sub>	02 <sub>H</sub>
								03 <sub>H</sub>
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮	⋮
1	1	1	1	1	1	0	7E <sub>H</sub>	FC <sub>H</sub>
								FD <sub>H</sub>
1	1	1	1	1	1	1	7F <sub>H</sub>	FE <sub>H</sub>
								FF <sub>H</sub>

## (d) Internal resistor ratio set

The “Internal resistor ratio set” instruction is used to determine the internal resistor ratio (1+R<sub>b</sub>/R<sub>a</sub>) for the voltage regulator. For more information, refer to (3-3) “Setting for internal resistor ratio”.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	0	0	1	0	0	R <sub>2</sub>	R <sub>1</sub>	R <sub>0</sub>

R <sub>2</sub>	R <sub>1</sub>	R <sub>0</sub>	1+(R <sub>b</sub> /R <sub>a</sub> )
0	0	0	2.3
0	0	1	3.0
0	1	0	3.7
0	1	1	4.4
1	0	0	5.1
1	0	1	5.8
1	1	0	6.5
1	1	1	7.2

## (e) Power control set

The “Power control set” instruction is used to configure the internal power circuits. For more information, refer to (3) “Internal power circuits”.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	0	0	1	0	1	VC	VR	VF

VC	VR	VF	
0	-	-	Voltage converter OFF
1	-	-	Voltage converter ON
-	0	-	Voltage regulator OFF
-	1	-	Voltage regulator ON
-	-	0	Voltage followers OFF
-	-	1	Voltage followers ON

(f) Initial display line set

The “Initial display line set” instruction is used to specify the line address, which corresponds to the initial COM<sub>0</sub> line (COM<sub>0</sub>).

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	
0	0	0	1	0	0	0	0	*	*	Set initial display line
0	0	*	L <sub>6</sub>	L <sub>5</sub>	L <sub>4</sub>	L <sub>3</sub>	L <sub>2</sub>	L <sub>1</sub>	L <sub>0</sub>	Specify line address

L <sub>6</sub>	L <sub>5</sub>	L <sub>4</sub>	L <sub>3</sub>	L <sub>2</sub>	L <sub>1</sub>	L <sub>0</sub>	Line address
0	0	0	0	0	0	0	0
0	0	0	0	0	0	1	1
0	0	0	0	0	1	0	2
:	:	:	:	:	:	:	:
1	1	1	1	1	0	1	125
1	1	1	1	1	1	0	126
1	1	1	1	1	1	1	127

(g) Initial COM<sub>0</sub> line set

The “Initial COM<sub>0</sub> line set” instruction is specify the common driver, which starts scanning the display data in the DDRAM.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	
0	0	0	1	0	0	0	1	*	*	Set initial COM <sub>0</sub> line
0	0	*	C <sub>6</sub>	C <sub>5</sub>	C <sub>4</sub>	C <sub>3</sub>	C <sub>2</sub>	C <sub>1</sub>	C <sub>0</sub>	Specify initial COM <sub>0</sub>

C <sub>6</sub>	C <sub>5</sub>	C <sub>4</sub>	C <sub>3</sub>	C <sub>2</sub>	C <sub>1</sub>	C <sub>0</sub>	Initial COM <sub>0</sub>
0	0	0	0	0	0	0	COM <sub>0</sub>
0	0	0	0	0	0	1	COM <sub>1</sub>
0	0	0	0	0	1	0	COM <sub>2</sub>
:	:	:	:	:	:	:	:
1	1	1	1	1	0	1	COM <sub>125</sub>
1	1	1	1	1	1	0	COM <sub>126</sub>
1	1	1	1	1	1	1	COM <sub>127</sub>

(h) Partial display duty set

The “Partial display duty set” instruction is used to specify the duty cycle ratio for the partial display. The LSI can be programmed to select not only the duty cycle ratio, but also the LCD bias ratio, boost level and contrast level by the instructions so that it is possible to optimize the LSI's condition in accordance with the partial display status. For more information, refer to (7) “Partial display function”.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	
0	0	0	1	0	0	1	0	*	*	Set partial display duty
0	0	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	Specify duty cycle ratio

D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	Duty
0	0	0	0	0	0	0	0	Invalid
:	:	:	:	:	:	:	:	
0	0	0	0	1	1	1	1	
0	0	0	1	0	0	0	0	1/16
:	:	:	:	:	:	:	:	:
1	0	0	0	0	0	0	0	1/128
1	0	0	0	0	0	0	1	Invalid
:	:	:	:	:	:	:	:	
1	1	1	1	1	1	1	1	

## (i) N-line inversion register set

The “N-line inversion register set” instruction is used to control the alternate rates of the crystal polarization on an LCD panel. In the N-line inversion mode, the FR signal toggles once every N frames, which number is selected in between 3 and 33 lines, and therefore, prevents a cross talk. If the N-line inversion is disabled by the “N-line inversion mode OFF” instruction, the FR signal toggles by the frame.

The number of the N-line should not be set to 1/2 of the display duty cycle ratio in order to avoid generating a DC bias when the partial display is used.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	0	1	0	0	1	1	*	*
0	0	*	*	*	N <sub>4</sub>	N <sub>3</sub>	N <sub>2</sub>	N <sub>1</sub>	N <sub>0</sub>

Set N-line inversion  
Specify N-line number

N <sub>4</sub>	N <sub>3</sub>	N <sub>2</sub>	N <sub>1</sub>	N <sub>0</sub>	Number of N-line
0	0	0	0	0	0
0	0	0	0	1	3 lines
:	:	:	:	:	:
1	1	1	1	0	32 lines
1	1	1	1	1	33 lines

## (j) LCD bias set

The “LCD bias set” instruction is used to select the LCD bias ratio. For more information, refer to (3-8) “Voltage followers”.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	0	1	0	1	0	B <sub>2</sub>	B <sub>1</sub>	B <sub>0</sub>

B <sub>2</sub>	B <sub>1</sub>	B <sub>0</sub>	Bias
0	0	0	1/5
0	0	1	1/6
0	1	0	1/7
0	1	1	1/8
1	0	0	1/9
1	0	1	1/10
1	1	0	1/11
1	1	1	1/12

## (k) Boost level set

The “Boost level set” instruction is used to select the multiple for the voltage converter. For detailed information, refer to (3-1) “Voltage converter”.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	0	1	1	0	0	1	B <sub>1</sub>	B <sub>0</sub>

B <sub>1</sub>	B <sub>0</sub>	Boost
0	0	3x
0	1	4x
1	0	5x
1	1	6x

## (l) Contrast level set

The “Contrast level set” instruction is used to fine-tune the LCD driving voltage ( $V_{LCD}$ ) in accordance with an LCD panel. For detailed information, refer to (3-2) “Voltage regulator”.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	0	0	0	0	0	1
0	0	*	*	C <sub>5</sub>	C <sub>4</sub>	C <sub>3</sub>	C <sub>2</sub>	C <sub>1</sub>	C <sub>0</sub>

Set contrast level  
Specify contrast level

(m) ADC select

The “ADC select” instruction is used to reverse the column address assignment for the segment drivers, so that it is possible to reduce the restriction for the placement of the LSI in an LCD module. For more information, refer to “- Connection between the LSI and LCD panel”.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	1	0	0	0	0	S <sub>0</sub>

S <sub>0</sub>	Segment direction
0	SEG <sub>0</sub> to SEG <sub>127</sub>
1	SEG <sub>127</sub> to SEG <sub>0</sub>

(n) Entire display ON/OFF

The “Entire display ON/OFF” instruction is used to enable or disable the entire display, which turns on all pixels without changing the display data in the DDRAM.

The “Entire display ON/OFF” instruction has a priority over the “Reverse display ON/OFF” instruction and the “Display ON/OFF” instruction has the priority over the “Entire display ON/OFF” instruction. As a result, even though the “Entire display ON” can be accepted during the “Display OFF”, the visual state of the LCD panel does not change.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	1	0	0	1	0	E <sub>0</sub>

E <sub>0</sub>	Mode
0	Entire display OFF (Normal)
1	Entire display ON

(o) Reverse display ON/OFF

The “Reverse display ON/OFF” instruction is used to enable or disable the reverse display, which reverses the illumination of each pixel without changing the display data in the DDRAM.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	1	0	0	1	1	R <sub>0</sub>

R <sub>0</sub>	Mode
0	Reverse display OFF (Normal)
1	Reverse display ON

Reverse display OFF (Normal)

Display data	1	1	1	0	0	1	0	0
Illumination								

Reverse display ON

Display data	1	1	1	0	0	1	0	0
Illumination								

(p) Power save mode ON

The “Power save mode ON” instruction is used to enable the power save mode, where it is possible to reduce the power consumption down to stand-by current level. Both of the LSI’s internal status and the display data in the DDRAM before the “Power save mode ON” instruction are maintained during the power save mode, in which it is possible to access to the DDRAM. The internal status of the LSI in the power save mode is listed below.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	1	0	1	0	0	1

Mode	Description
Power save mode	Oscillator OFF LCD power supply OFF COM/SEG outputs V <sub>SS</sub>

(q) Internal oscillator ON

The “Internal oscillator ON” instruction is used to enable the internal oscillator. Since the oscillator always turns off after the reset operation, this instruction must be executed for the initialization.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	1	0	1	0	1	1

(r) Display ON/OFF

The “Display ON/OFF” instruction is used to control the display ON or OFF without changing the display data in the DDRAM.

The “Display ON/OFF” instruction has a priority over the “Entire display ON/OFF” and “Reverse display ON/OFF” instructions. Accordingly, even though the “Entire display ON” and “Reverse display ON” instructions can be accepted during the “Display OFF”, the visual state of the LCD panel does not change.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	1	0	1	1	1	D <sub>0</sub>

D <sub>0</sub>	Mode
0	Display OFF
1	Display ON

(s) Page address set

The “Page address set” instruction is used to specify the page address for display data. It is required before the “Display data write” instruction.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	1	1	P <sub>3</sub>	P <sub>2</sub>	P <sub>1</sub>	P <sub>0</sub>

(t) COM scan direction select

The “COM scan direction select” is used to select the COM scan direction, so that it is possible to reduce the restriction for the placement of the LSI in an LCD module. For more information, refer to “-Connection between the LSI and LCD panel”.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	1	0	0	S <sub>0</sub>	*	*	*

S <sub>0</sub>	COM scan direction
0	COM <sub>0</sub> to COM <sub>127</sub>
1	COM <sub>127</sub> to COM <sub>0</sub>

(u) Power save mode OFF

The "Power save mode OFF" instruction is used to release the LSI from the power save mode.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	1	1	0	0	0	0	1

(v) Reset

The "Reset" instruction is used to reset the LSI to the following status. It doesn't change the display data in the DDRAM. It cannot be substituted for the reset operation by the RES terminal. For more information regarding to the reset operation by the RES terminal, refer to (1-8) "Reset circuits".

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	1	1	0	0	0	1	0

Reset status by "Reset" instruction

1. Page address : (0) page
2. Column address : (00)<sub>H</sub>
3. Initial display line : (00)<sub>H</sub>
4. Contrast level set : 32 level
5. Internal resistor ratio :  $1+R_b/R_a=2.3$
6. Display data length : (0,0,0,0)
7. White mode set : OFF

1	1	15-level

## (z) Gray scale mode and register set

The “Gray scale mode and register set” instruction is composed of two bytes and is used to specify the contrast level for each of the gray scale modes. The first byte specifies the gray scale mode and the frame number, and then the second byte sets pallet values into the specified 4-bit pallet register. For detailed information regarding the gray scale function, refer to (5) “Gray scale function”.

0	Gray scale mode
1	Black & White mode

## (bb) Test mode

This instruction is used only for manufacturer's tests.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	1	1	1	*	*	*	*

## (3) Internal power circuits

The internal power circuits are composed of the voltage converter, voltage regulator with 64-level EVR, and voltage followers. The status of the internal power circuits is arranged by the "Power control set" instruction, as shown in Table 4. For this arrangement, the part of the internal power circuits can be used in combination with an external power supply, as shown in Table 5.

The internal power circuits require the optimum values for the passive components, such as V<sub>0</sub> to V<sub>4</sub> capacitors and external feedback resistors in accordance with an LCD panel; and accordingly should be evaluated by using of actual LCD module samples to decide these values.

Table 4. Power control set

Bits	Portions	Status	
V <sub>C</sub>	Voltage converter	1: ON	0: OFF
V <sub>R</sub>	Voltage regulator	1: ON	0: OFF
V <sub>F</sub>	Voltage followers	1: ON	0: OFF

Table 5. Power supply combinations

Combination	Instruction			Power supply circuits			Output terminals		
	V <sub>C</sub>	V <sub>R</sub>	V <sub>F</sub>	Voltage converter	Voltage regulator	Voltage followers	V <sub>OUT</sub>	V <sub>0</sub>	V <sub>1</sub> -V <sub>4</sub>
Using all internal power circuits	1	1	1	ON	ON	ON	Open	Open	Open
Using voltage regulator and voltage followers	0	1	1	OFF	ON	ON	External	Open	Open
Using voltage followers	0	0	1	OFF	OFF	ON	Open	External	Open
Using only external power Supply	0	0	0	OFF	OFF	OFF	Open	External	External

Note) Decoupling capacitors on the V<sub>0</sub> to V<sub>4</sub> terminals are required when the voltage followers are enabled.

## (3-1) Voltage converter

The voltage converter is designed to generate a maximum 6x voltage from the voltage difference between the  $V_{CI}$  and  $V_{SS}$  terminals. It is programmed so that the boost level can be selected out of 3x, 4x, 5x or 6x by the "Boost level set" instruction. Since the voltage converter operates by using of the internal clocks supplied from the oscillator, the oscillator is required to be working during the voltage converter operation. The boosted voltage  $V_{OUT}$  must not exceed beyond the 18.0V described in "Absolute maximum ratings". Otherwise, the voltage stress may cause a permanent damage to the LSI. Fig.4 illustrates the capacitor connections for the voltage converter.

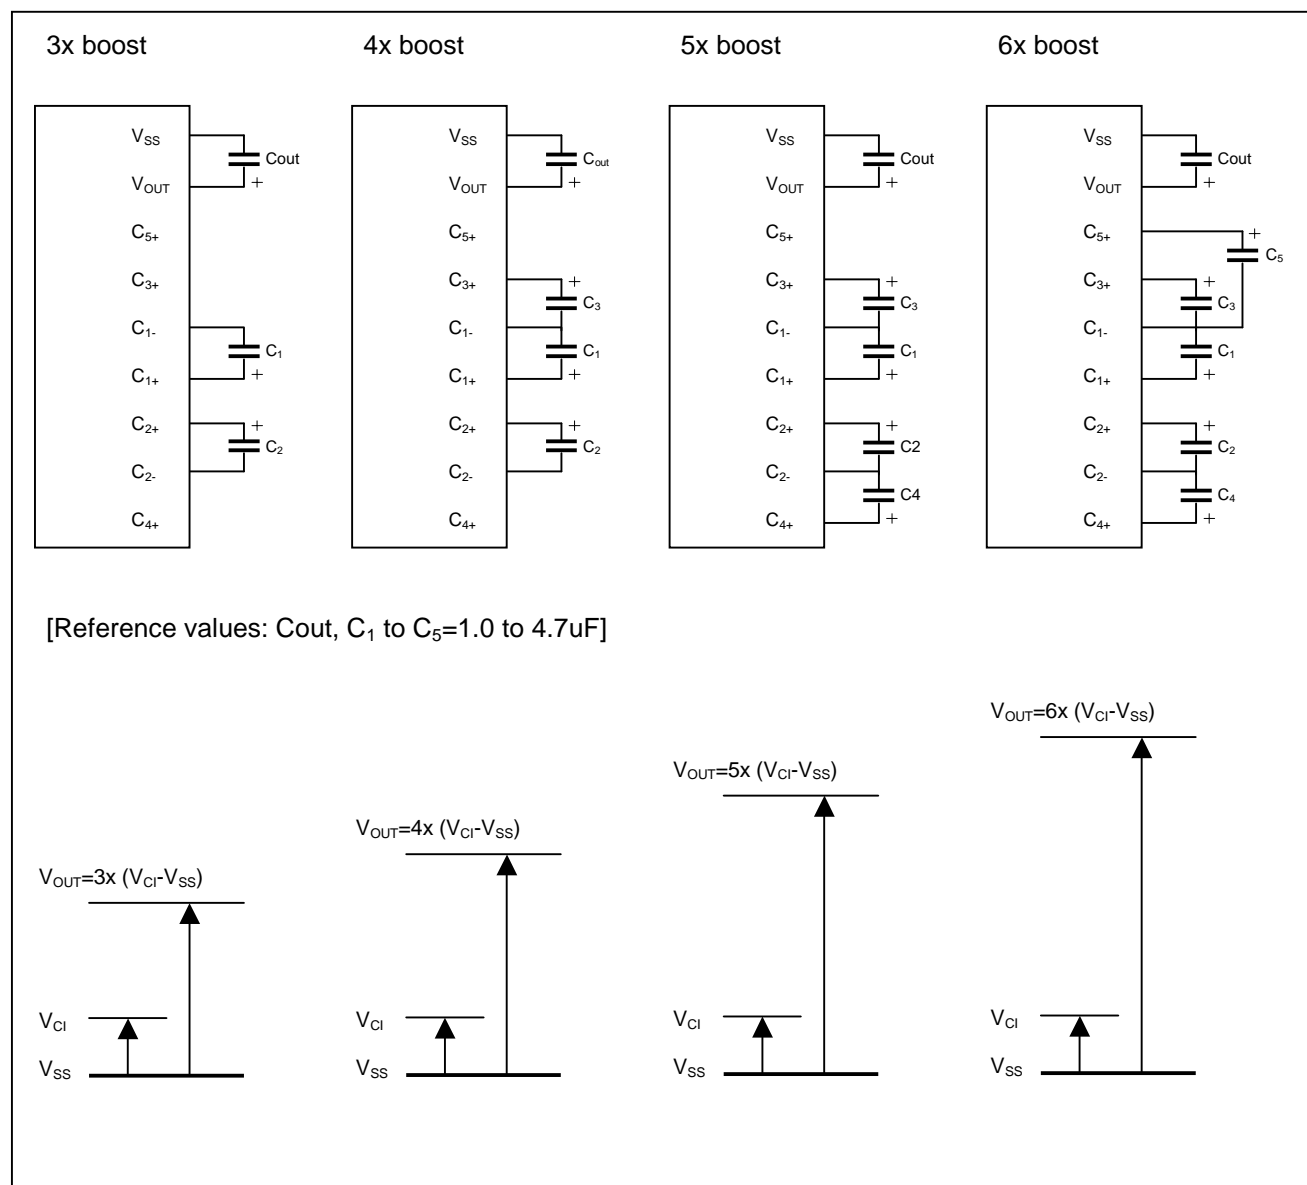

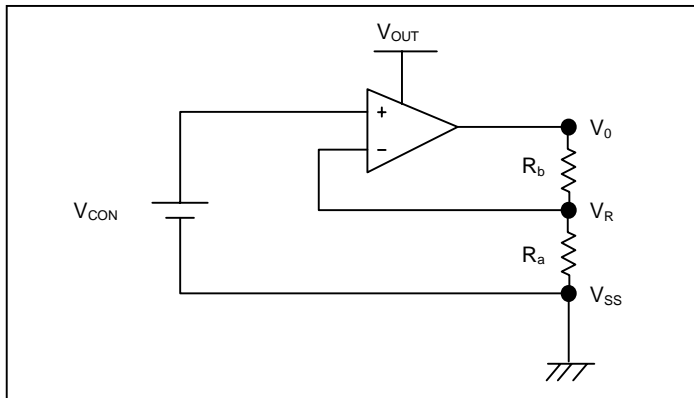

Fig.4 Capacitors connections for the voltage converter

### (3-2) Voltage regulator

The voltage regulator is composed of the reference voltage generator, 64-level EVR, operational amplifier, and internal (or external) feedback resistors, as illustrated in Fig.5 and used to generate the LCD driving voltage  $V_0$ . In the voltage regulator, the reference voltage  $V_{REF}$  is gained with the EVR to produce regulated voltage  $V_{CON}$ , which is used for the input voltage of the internal operational amplifier. Namely, the  $V_0$  is determined in accordance with the setting for the EVR and internal (or external) resistor ratio, as calculated by the following equations [1] and [2].

$$V_0 = (1 + R_b/R_a) \times V_{CON} \quad [1]$$

$$V_{CON} = (1 - (63 - n)/210) \times V_{REF} \quad [2]$$

$V_0$  : LCD driving voltage  
 $R_a, R_b$  : Feed back resistors  
 $V_{CON}$  : Contrast control voltage  
 $n$  : Parameter decided instruction  
 $V_{REF}$  : Reference voltage

Fig.5 Voltage regulator

### (3-3) Setting for internal resistor ratio

Either external or internal feedback resistors can be selected by setting the INTRS terminal to "0" or "1", as shown in Table 6. In case that the internal resistors are used, the resistor ratio  $(1 + R_b/R_a)$  can be selected by the "Internal resistor ratio" instruction, as listed in Table 7.

Table 6. Setting for the INTRS terminal

INTRS	Ra, Rb
0	External resistors
1	Internal resistors

Table 7. Setting for the internal resistor ratio

$R_2$	$R_1$	$R_0$	$1 + (R_b/R_a)$
0	0	0	2.3
0	0	1	3.0
0	1	0	3.7
0	1	1	4.4
1	0	0	5.1
1	0	1	5.8
1	1	0	6.5
1	1	1	7.2

### (3-4) Contrast control voltage VCON

In the equation [2], the VCON depends on the parameter "n", which is determined in between 0 and 63 by the "Contrast level set" instruction.

Table 8. Setting for the contrast level

C5	C4	C3	C2	C1	C0	n	$V_{CON}$
0	0	0	0	0	0	0	MIN.
:	:	:	:	:	:	:	:
1	1	1	1	1	1	63	MAX.

## (3-5) Reference voltage $V_{REF}$

Either external or internal reference voltage  $V_{REF}$  is selected by setting the REF terminal to "0" or "1", as shown in Table 9. When the internal reference voltage  $V_{REF}$  is selected, the  $V_{REF}$  is designed to be 2.1V Typ. and its temperature coefficient becomes -0.125%/°C Typ.

Table 9. Setting for the REF terminal

REF	$V_{REF}$ (V)	Temperature coefficient
0	External voltage on the VEXT terminal	-
1	Internal voltage ( $V_{REF}=2.1V$ Typ.)	-0.125%/°C Typ.

## (3-6) Range for the contrast control

The LCD driving voltage  $V_0$  is determined in accordance with the setting for the EVR and the internal (or external) resistor ratio. Fig.6 graphs the range for the contrast control using the "Contrast level set" and "Internal resistor set" instructions.

Fig.6 Range for the contrast control

(3-7) Using external Ra and Rb resistors

In case that the external feedback resistors (Ra, Rb) are used by setting the INTRIS terminal to "0", these external resistors are required to be placed between the V<sub>SS</sub> and V<sub>R</sub> and between the V<sub>R</sub> and V<sub>0</sub> terminals. The LCD driving voltage V<sub>0</sub> is determined in accordance with the setting for the EVR and the external resistor ratio (1+Rb/Ra) in the following equations [1] and [2], as well as the setting in using the internal resistors Ra and Rb.

$$V_0 = (1+Rb/Ra) \times V_{CON} \quad [1]$$

$$V_{CON} = (1-(63-n)/210) \times V_{REF} \quad [2]$$

V<sub>0</sub> : LCD driving voltage  
 Ra, Rb : Feed back resistors  
 V<sub>CON</sub> : Contrast control voltage  
 n : Parameter decided instruction  
 V<sub>REF</sub> : Reference voltage

The following calculations describe the setting example to decide the external resistors Ra and Rb values.

Requirements:

1. LCD driving voltage V<sub>0</sub>=14.0V (when the contrast level parameter "n"=32)
2. The maximum current flowing through the external Ra and Rb = 5uA

Calculations:

Following the equation [2],

$$V_{CON} = (1-(63-32)/210) \times 2.1V = 1.79V$$

Following the equation [1],

$$Rb/Ra = V_0/V_{CON} - 1 = 14.0V/1.79V - 1 = 6.821 \text{ -----[A]}$$

Following the requirement 2,

$$Ra+Rb = 14.0V/5uA = 2.8M \text{ ohm -----[B]}$$

Finally, the values for the Ra and Rb are determined by the results [A] and [B],

Ra = 0.358M ohm

Rb = 2.442M ohm

Contrast level [n]	V <sub>0</sub> [V]
0	11.5V
:	:
32	14.0V
:	:
63	16.4V

(3-8) Voltage followers

The voltage followers are used to stabilize and output the LCD driving voltages (V<sub>0</sub>, V<sub>1</sub>, V<sub>2</sub>, V<sub>3</sub> and V<sub>4</sub>), which are produced by the internal bleeder resistors. It can be programmed to select the LCD bias in the range of 1/5 and 1/12 by the "LCD bias set" instruction. Generally, the optimum bias ratio is determined by the following equation: LCD bias ratio=1/(1+(√duty ratio)). For instance, in case of 1/80 duty cycle ratio, it should be 1/10 in accordance with the calculation: 1/(1+(√80)).

When the voltage followers are used, the capacitors for the V<sub>0</sub> to V<sub>4</sub> terminals are required in order to stabilize the LCD driving voltages and should be in between 0.47uF and 2.0uF.

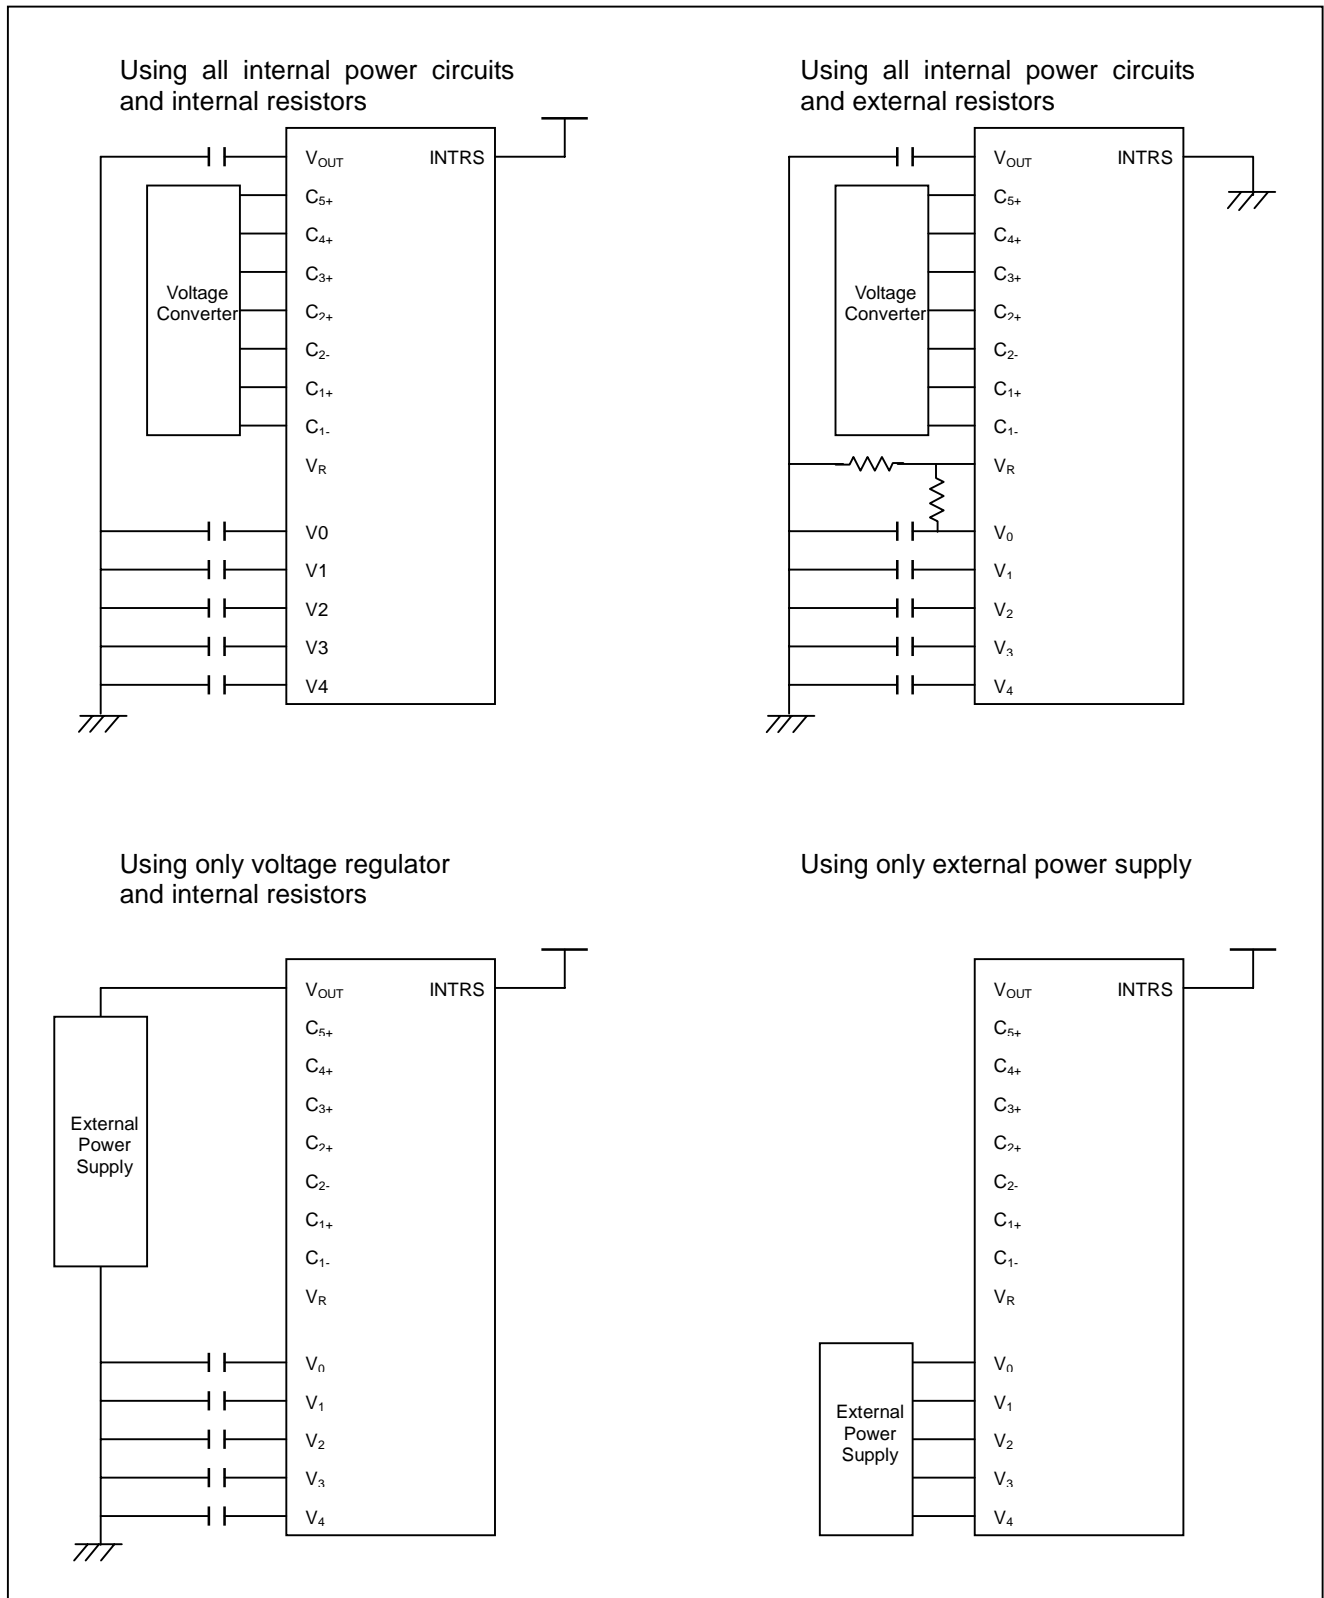

Fig.7 Power circuits configuration

## (4) MPU Interface

### (4-1) Interface type selection

The interface type (the parallel or serial interface) is determined by the condition of the  $PS_0$  and  $PS_1$  terminals connecting to "H" or "L" level as shown in Table 10. In the 3- or 4- line serial interface mode, the "Status read" instruction cannot be used.

Table 10

$PS_0$	$PS_1$	Type	$\overline{CS}$	RS	E	W/R	Data bus terminals
L	L	3-line serial	$\overline{CS}$	*	*	*	SI, SCL
L	H	4-line serial	$\overline{CS}$	RS	*	*	SI, SCL
H	L	80-type MPU parallel	$\overline{CS}$	RS	$\overline{RD}$	$\overline{WR}$	$D_7$ to $D_0$
H	H	68-type MPU parallel	$\overline{CS}$	RS	E	R/W	$D_7$ to $D_0$

\*:Don't care

### (4-2) Parallel interface

In the 68- or 80- type PU parallel inter face mode, the transferred data on the  $D_7$  to  $D_0$  terminals is processed in accordance with the polarities of the RS,  $E(\overline{RD})$ , and R/W(WR) signals as shown in table 11.

Table 11 Data Distinction

$\overline{CS}$	RS	68 type		80 type		Operation
		E	R/W	$\overline{RD}$	WR	
L	H	H	H	L	H	None
L	H	H	L	H	L	Write display data
L	L	H	H	L	H	Read out status read
L	L	H	L	H	L	Write instruction data

### (4-3) Serial Interface

In the serial interface mode, when the chip select is active ( $\overline{CS} = "0"$ ) the SI and SCL are enabled. While the chip select is not active ( $\overline{CS} = "1"$ ), the SI & SCL are disabled and the internal 8-bit shift register and the 3-bit counter are being initialized. The 8-bit serial data on the SI terminal is fetched at the at the rising edge of the SCL signals in order of  $D_7, D_6 \dots D_0$  data, and the fetched data is converted into 8-bit parallel data on the 8<sup>th</sup> SCL signals.

#### (a) 4-line serial interface

In the 4-line serial interface mode, the transferred data on the SI terminal is distinguished as display data or instruction data in accordance with the polarity of the RS signal at the 8th SCL signal, as illustrated in Fig. 8-1.

Fig. 8-1 4-line serial interface timing

## (b) 3-line serial interface

In the 3-line serial interface mode, the “Display data length set” instruction is used to specify the data length in between 1 and 256 bytes for the display data transferred to the DDRAM. The “Display data length set” instruction is executed by 2 bytes data, after which the display data can be continuously transferred. The next transferred data after the display data is distinguished as instruction data. Fig 8-2 illustrates the timing and setting example for the data transmission in the 3-line serial interface mode.

When the chip select becomes non-active ( $\overline{CS}$ ="1") during a serial display data stream, the interrupted byte data is invalid, however all previous transferred display data is valid and next transferred data will be distinguished as instruction data.

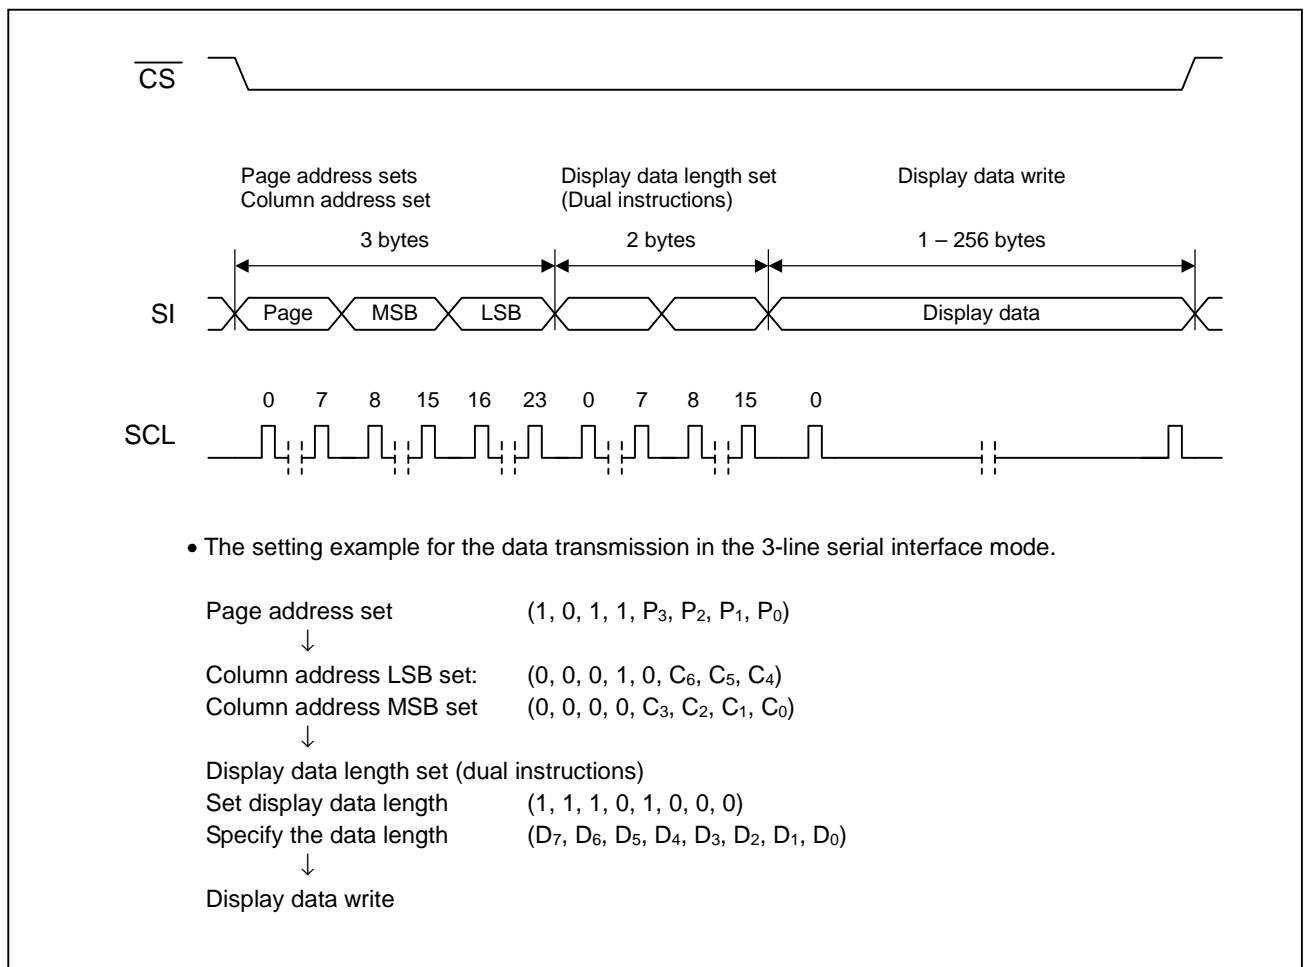

Fig 8-2 3-line serial interface timing

## (5) Gray scale function

### (5-1) FRC (Frame Rate Control) and PWM (Pulse Width Modulation)

The 4-gray scale function is controlled by the setting for the FRC and PWM configurations and the palette values into the 4-bit palette registers, and provides required gray scale levels. This setting is executed by the “FRC & PWM set” and “Gray scale mode and register set” instructions, as described in the following.

### (5-2) FRC & PWM set

The “FRC & PWM set” instruction is used to specify the PWM and FRC configurations.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	0	0	1	0	FRC	PWM <sub>1</sub>	PWM <sub>0</sub>

FRC	Frame rate
0	4-frame
1	3-frame

PWM <sub>1</sub>	PWM <sub>0</sub>	PWM level
0	0	9-level
0	1	9-level
1	0	12-level
1	1	15-level

### (5-3) Gray scale mode & Register set

The “Gray scale mode and register set” instruction is composed of two bytes and used to specify the contrast level for each of the gray scale modes. The first byte specifies the gray scale mode and frame number and then the second byte sets the pallet value into the specified 4-bit pallet register.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	Gray scale mode & frame 4-bit pallet register set
0	0	1	0	0	0	1	GM <sub>2</sub>	GM <sub>1</sub>	GM <sub>0</sub>	
0	0	4-bit pallet register				4-bit pallet register				

GM <sub>2</sub>	GM <sub>1</sub>	GM <sub>0</sub>	Gray scale mode & Frame	
0	0	0	White mode	1st/2nd frame
0	0	1		3rd/4th frame
0	1	0	Light gray mode	1st/2nd frame
0	1	1		3rd/4th frame
1	0	0	Dark gray mode	1st/2nd frame
1	0	1		3rd/4th frame
1	1	0	Black mode	1st/2nd frame
1	1	1		3rd/4th frame

## (5-4) Setting tables for the FRC and PWM

Table 12-1. Gray scale table for the 4-FRC

Gray scale level	Display data	MSB (D <sub>7</sub> to D <sub>4</sub> )	LSB (D <sub>3</sub> to D <sub>0</sub> )
White	00	2nd frame	1st frame
		4th frame	3rd frame
Light gray	01	2nd frame	1st frame
		4th frame	3rd frame
Dark gray	10	2nd frame	1st frame
		4th frame	3rd frame
Black	11	2nd frame	1st frame
		4th frame	3rd frame

Table 12-2. Gray scale table for the 3-FRC

Gray scale level	Display data	MSB (D <sub>7</sub> to D <sub>4</sub> )	LSB (D <sub>3</sub> to D <sub>0</sub> )
White	00	2nd frame	1st frame
		*	3rd frame

1,0,1,0	0	10/12	10/15
1,0,1,1	0	11/12	11/15
1,1,0,0	0	1	12/15
1,1,0,1	0	0	13/15
1,1,1,0	0	0	14/15
1,1,1,1	0	0	1

(6) Black & White mode

As an extended function, the LSI is designed to support the black & white mode, which can be switched from the gray scale mode by the "Display mode set" instruction. The gray scale mode is set in the default status.

(6-1) Display mode set instruction

The "Display mode set" instruction is used to select either gray scale or black & white mode. It is required that the "Display OFF" instruction and DDRAM initialization are executed before the "Display mode set" instruction.

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	1	1	1	1	0	1	1	1	DM <sub>0</sub>

DM <sub>0</sub>	Display mode
0	Gray scale mode
1	Black & White mode

(6-2) Display data RAM (DDRAM)

Although the DDRAM's capability in the gray scale mode is 32,768-bit (128-line by 256-column) for the LCD panel with up to 128x128 pixels, the capability in the black & white mode is 16,384-bit out of the total memory area, as illustrated in the Fig 9. In the black and white mode, 1-bit display data is used for 1-pixel.

(6-3) Column address set

In the black & white mode, an MPU can access 7-bit [C6:C0] column address by the "Column address LSB set" and "Column address MSB set" instructions. The column address automatically increases by 1 (+1) after each 1-byte display data.

(6-4) Display data length set

The "Display data length set" instruction is used in the 3-line serial interface mode in order to specify the data length in between 1 and 128 bytes in the black & white mode. The D<sub>7</sub> bit in the "Display data length set" instruction must be "0".

RS	R/W	D <sub>7</sub>	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>
0	0	1	1	1	0	1	0	0	0
0	0	(D <sub>7</sub> )	D <sub>6</sub>	D <sub>5</sub>	D <sub>4</sub>	D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>

Set display data length  
Specify the data length

(D<sub>7</sub>) : Must be "0" in the black & white mode

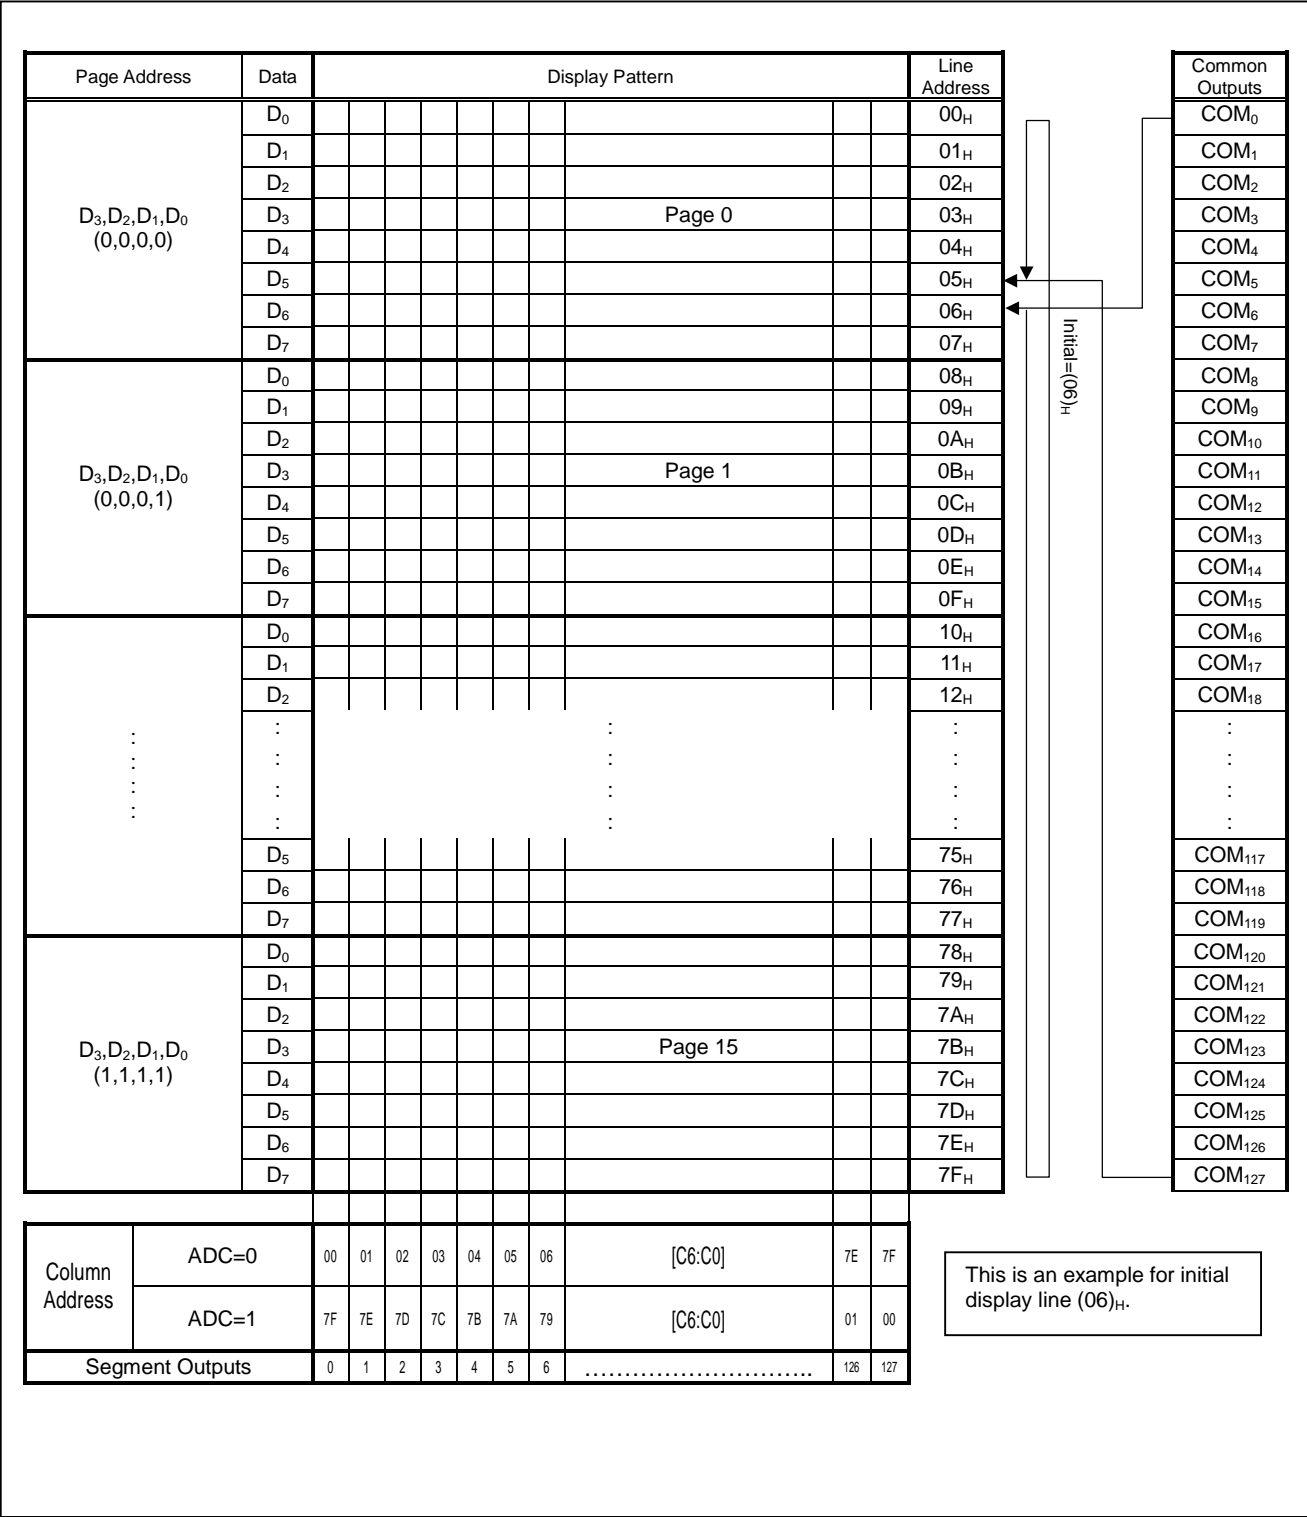

Fig.9 Display data RAM (DDRAM) Map in the Black & White mode

(7) Partial display function

The partial display function is used to specify optimum duty cycle ratio, LCD bias ratio, boost level and LCD driving voltage to partially display active area on an LCD panel, so that it is possible to display the time and calendar under extremely low power consumption state. It can be programmed to select the duty cycle ratio, LCD bias ratio, boost level and EVR level by the instructions. Fig.10-1 illustrates normal display image and Fig.10-2, 10-3 and 10-4 illustrate the partial display images. The setting sequence for the partial display is described in Fig.15.

Fig.10-1 Normal display image (duty cycle ratio=1/128, COM<sub>0</sub>=0)

Fig.10-2 Partial display image 1 (duty cycle ratio=1/120, COM<sub>0</sub>=0)

Fig.10-3 Partial display image 2 (duty cycle ratio=1/16, COM<sub>0</sub>=112)

Fig.10-4 Partial display image 3 (duty cycle ratio=1/112, COM<sub>0</sub>=9)

## ■ ABSOLUTE MAXIMUM RATING

(Ta=25°C)

PARAMETER		SYMBOL	RATINGS	UNIT
Supply Voltage(1)		$V_{DD}, V_{CI}$	-0.3 to +4.0	V
Supply Voltage(2)		$V_0, V_{OUT}$	$V_{SS}-0.3$ to $V_{SS}+18.0$	V
Supply Voltage(3)		$V_1, V_2, V_3, V_4$	-0.3 to $V_0+0.3$	V
Input Voltage		$V_{IN}$	-0.3 to $V_{DD}+0.3$	V
Operating Temperature		$T_{OPR}$	-40 to +85	°C
Storage Temperature	TCP	$T_{STG}$	-55 to +100	°C
	Chip		-55 to +125	

Note 1) All voltages are relative to  $V_{SS}=0V$  reference.

The relationship among the supply voltages should be maintained in the following condition:

$$V_{SS} \leq V_4 \leq V_3 \leq V_2 \leq V_1 \leq V_0 \leq V_{OUT}$$

Note 2) When the external power supply is used for the LCD driving voltages, the external power supply should be turned on at the same timing or after the timing that the  $V_{DD}$  is turned on.

Note 3) The LSI should be operated inside of the "Absolute maximum ratings" in order to prevent excessive stress. Otherwise, the stresses beyond the "Absolute Maximum Ratings" may cause a permanent damage to the LSI.

Note 4) The decoupling capacitors between the  $V_{DD}$ ,  $V_{CI}$ , and  $V_{SS}$  terminals are required in order to stabilize the LSI operation.

## ELECTRICAL CHARACTERISTICS

( $V_{DD}=2.2$  to  $3.6V$ ,  $V_{SS}=0V$ ,  $T_a=-40$  to  $+85^{\circ}C$ )

PARAMETER		SYMBOL	CONDITIONS		MIN.	TYP.	MAX.	UNIT	NOTE
Operating voltage(1)		$V_{DD}$	-		2.2	-	3.6	V	5
			$V_{DD}=2.7V$		2.7	2.775	2.875		
Operating voltage(2)		$V_{CI}$	6-times boost $V_{DD}=2.2$ to $3.0V$		$V_{DD}$	-	3.0	V	-
			3,4,5-times boost $V_{DD}=2.2$ to $3.6V$		$V_{DD}$	-	3.6		
Operating voltage(3)		$V_0$	$V_{LCD}=V_0-V_{SS}$		6.0	-	15.0	V	-
		$V_1, V_2$			$0.6V_0$	-	$V_0$		
		$V_3, V_4$			$V_{SS}$	-	$0.4V_0$		
Input Voltage	High Level	$V_{IH}$	-		$0.8V_{DD}$	-	$V_{DD}$	V	-
	Low Level	$V_{IL}$			$V_{SS}$	-	$0.2V_{DD}$		
Output Voltage	High Level	$V_{OH}$	D <sub>0</sub> to D <sub>1</sub> Terminal	$I_{OH}=-0.5mA$	$0.8V_{DD}$	-	$V_{DD}$	V	-
	Low Level	$V_{OL}$		$I_{OL}=0.5mA$	$V_{SS}$	-	$0.2V_{DD}$		
Input Leakage Current		$I_{LI}$	-		-1.0	-	1.0	$\mu A$	-
Output Leakage Current		$I_{LO}$	-		-3.0	-	3.0	$\mu A$	-
Driver On-resistance		$R_{ON}$	$V_0=8.0V$		-	3.0	4.5	$k\Omega$	6
Stand-by Current		$I_{sleep}$	In Power Save Mode		-	-	2.0	$\mu A$	7
Input Terminal Capacitance		$C_{IN}$	$T_a=25^{\circ}C$		-	10	-	pF	8
Frame Frequency		$f_{FR}$	$R_f=270k\Omega$		150	-	180	Hz	-
Reset Time		$t_R$	RES terminal		1.0	-	-	$\mu S$	9
Reset "L" level pulse Width		$t_{RW}$	-		10	-	-	$\mu S$	10

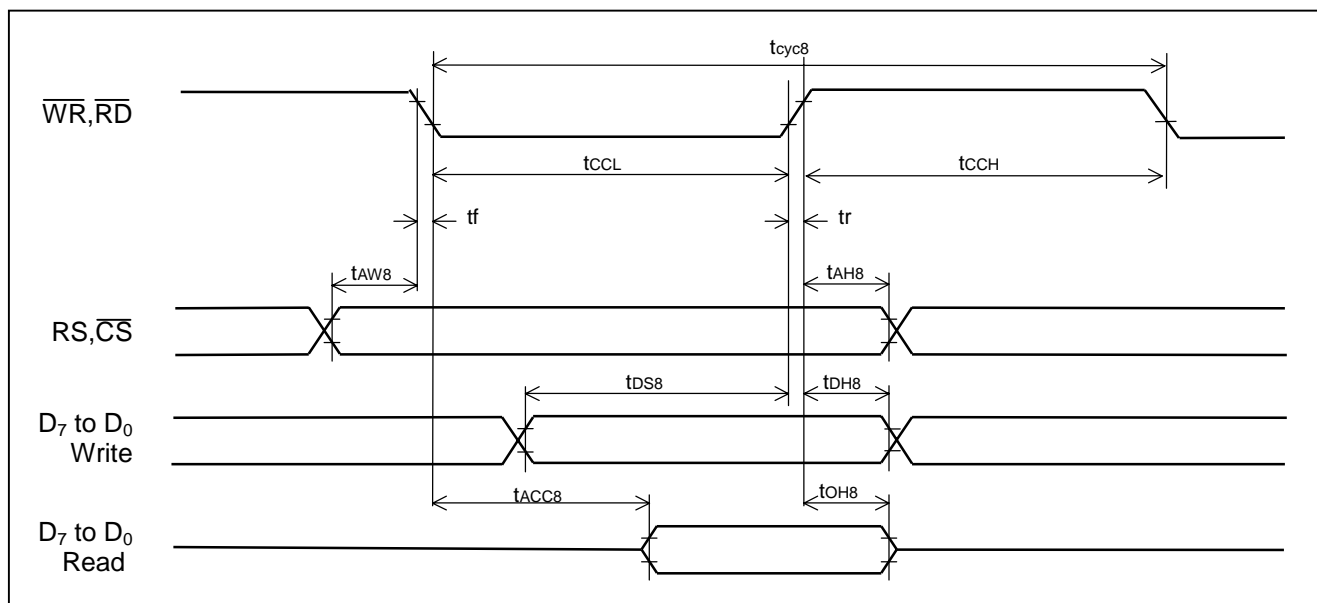

Input Voltage	$V_{CI}$	$V_{DD}-V_{SS}$ $V_{DD}=2.2$ to $3.0V$ 6-times boost	$V_{DD}$	-	3.0	V	11
Voltage converter efficiency	$V_{REG}\%$	No-load	95	99	-	%	-
Voltage Follower operating voltage	$V_0$	Voltage regulator "OFF"	6.0	-	16.5	V	-
Voltage converter output on resistance	$R_{STEP}$	$C_1$ to $C_5$ , $C_{OUT}=1.0\mu F$ 6-times boost	-	2.0	4.0	$k\Omega$	-
Operating Current	$I_{OUT1}$	$T_a=25^{\circ}C$ , $V_{DD}=2.75V$ (Checker board display, No access from MPU, All COM/SEG open)	-	400	550	$\mu A$	13
Reference Voltage	$V_{REF}$	$T_a=25^{\circ}C$	2.04	2.10	2.16	V	-
External reference voltage	$V_{EXT}$	-	2.0	-	$V_{DD}$	V	-
$V_{REF}$ temp.Coefficient	TC	$V_{DD}=3.0V$	-	-0.125	-	$\%/^{\circ}C$	-

- Note 5) This parameter cannot be guaranteed for the spike voltage during an MPU access.
- Note 6) Apply to the resistance between each driver (COM, SEG) and power supply ( $V_1, V_2, V_3, V_4$ ) terminals when the voltage difference 0.1V is supplied between these terminals.
- Note 7) Apply to the condition when the internal power circuits are not used and MPU doesn't access to the LSI.
- Note 8) Apply to the  $D_7$  to  $D_0$ , E, R/W, RS,  $\overline{CS}$ ,  $PS_0$  and  $PS_1$  terminals.
- Note 9) Specified the time between the rising edge of the  $\overline{RES}$  signal and the completion of the reset operation.
- Note 10) Specify the minimum pulse width of the  $\overline{RES}$  signal.
- Note 11) Apply to the  $V_{DD}$  when 6x boost level is used.
- Note 12) The LCD driving voltage can be adjusted within the operating range of the voltage converter.
- Note 13) Each of the values is specified by each of the following conditions.

SYMBOL	POWER SUPPLY SET INSTRUCTION			OPERATING CONDITION		
	VC	VR	VF	Voltage converter	Voltage regulator	Voltage follower
$I_{OUT1}$	1	1	1	ON (5 times)	ON	ON

## BUS TIMING CHARACTERISTICS

- Read/Write operation sequence(80 type MPU)

(V<sub>SS</sub>=0V, V<sub>DD</sub>=2.2V, Ta=-40 to +85°C)

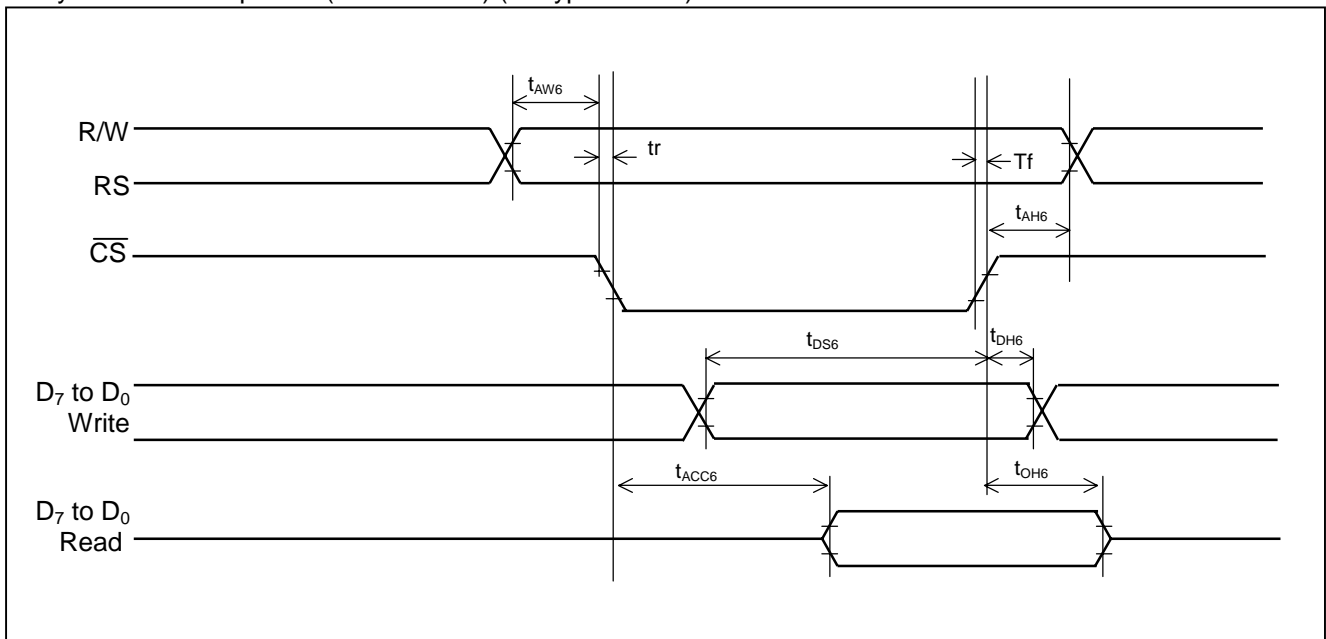

PARAMETER		SIGNAL	SYMBOL	Measurement Condition	MIN.	MAX.	UNIT
Address set up time		RS, $\overline{CS}$	t <sub>AW8</sub>	-	0	-	ns
Address hold time			t <sub>AH8</sub>		0	-	
System cycle time			t <sub>cyc8</sub>		330	-	
Control “H” pulse width	Read	$\overline{WR}, \overline{RD}$	t <sub>CCHR</sub>	-	210	-

## • Serial Interface

( $V_{SS}=0V$ ,  $V_{DD}=2.2V$ ,  $T_a=-40$  to  $+85^{\circ}C$ )

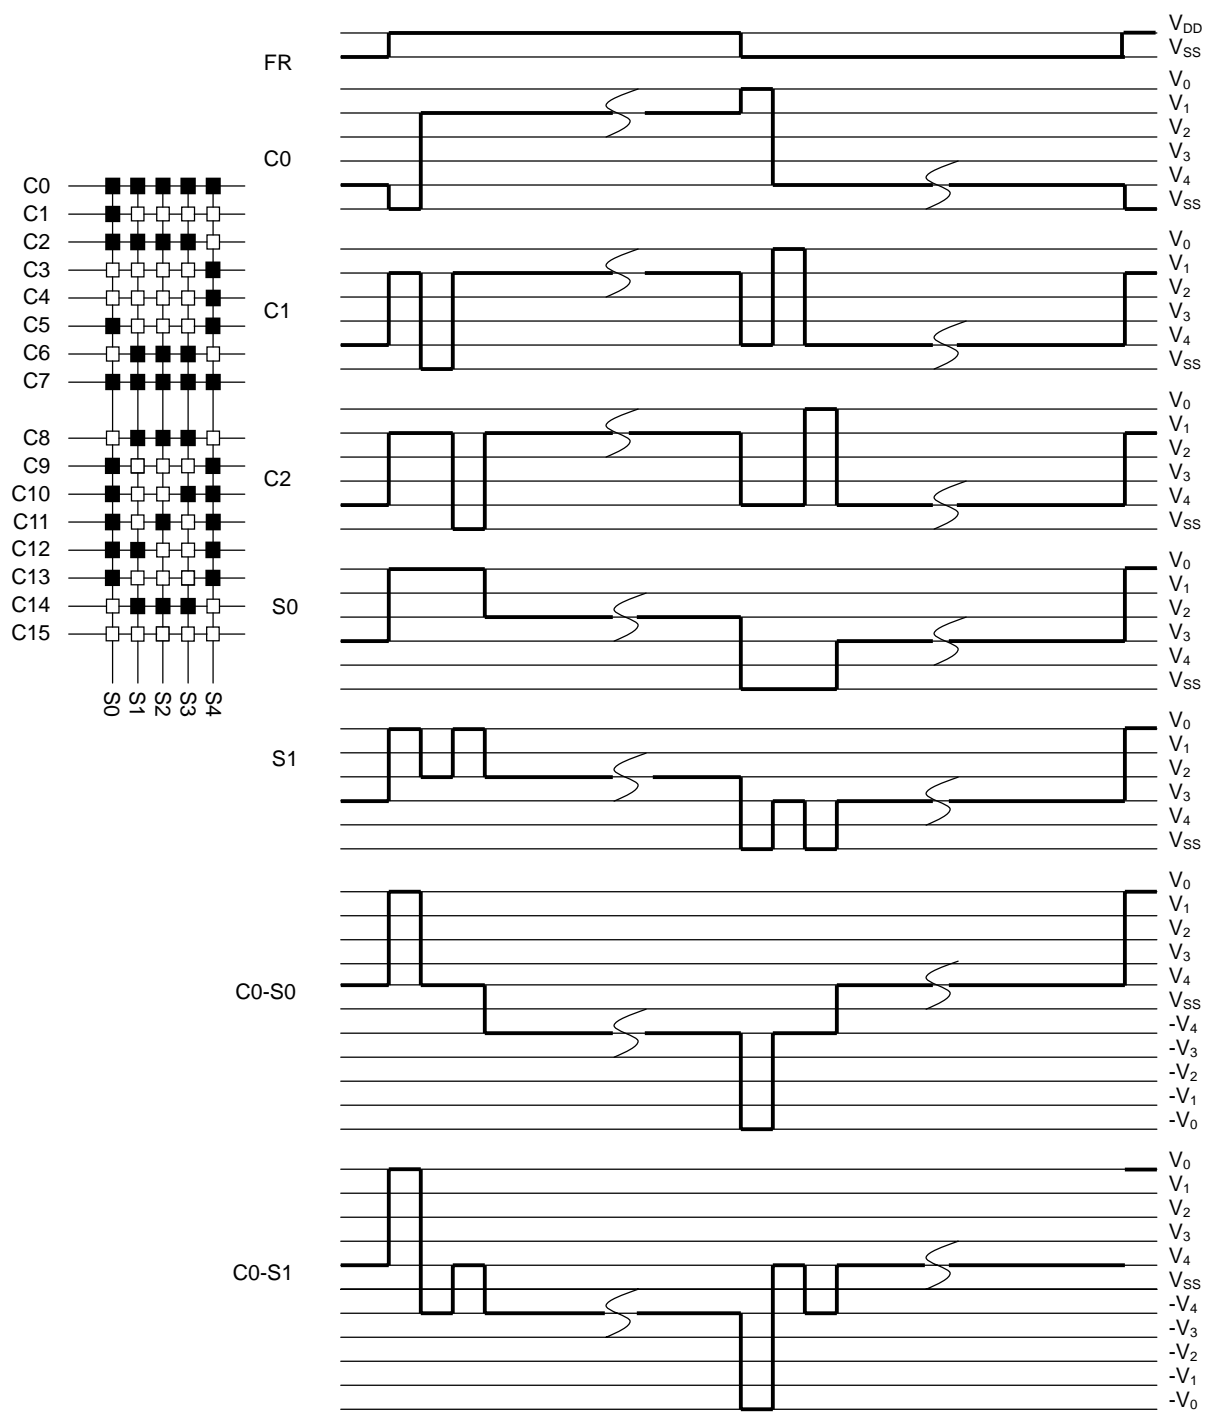

PARAMETER	SIGNAL	SYMBOL	Measurement Condition	MIN.	MAX.	UNIT
Serial clock cycle	SCL	$t_{scyc}$	-	110	-	ns
SCL "H" pulse width		$t_{SHW}$	-	40	-	
SCL "L" pulse width		$t_{SLW}$	-	40	-	
Address set up time	RS	$t_{SAS}$	-	60	-	
Address hold time		$t_{SAH}$	-	60	-	
Data set up time	SI	$t_{SDS}$	-	50	-	
Data hold time		$t_{SDH}$	-	60	-	
CS-SCL time	$\overline{CS}$	$t_{CSS}$	-	60	-	
		$t_{CSH}$	-	55	-	
Rising, falling edge	-	$t_r, t_f$	-	-	15	

( $V_{SS}=0V$ ,  $V_{DD}=3.0V$ ,  $T_a=-40$  to  $+85^{\circ}C$ )

PARAMETER	SIGNAL	SYMBOL	Measurement Condition	MIN.	MAX.	UNIT
Serial clock cycle	SCL	$t_{scyc}$	-	55	-	ns
SCL "H" pulse width		$t_{SHW}$	-	20	-	
SCL "L" pulse width		$t_{SLW}$	-	20	-	
Address set up time	RS	$t_{SAS}$	-	30	-	
Address hold time		$t_{SAH}$	-	30	-	
Data set up time	SI	$t_{SDS}$	-	25	-	
Data hold time		$t_{SDH}$	-	30	-	
CS-SCL time	$\overline{CS}$	$t_{CSS}$	-	30	-	
		$t_{CSH}$	-	27	-	
Rising, falling edge	-	$t_r, t_f$	-	-	15	

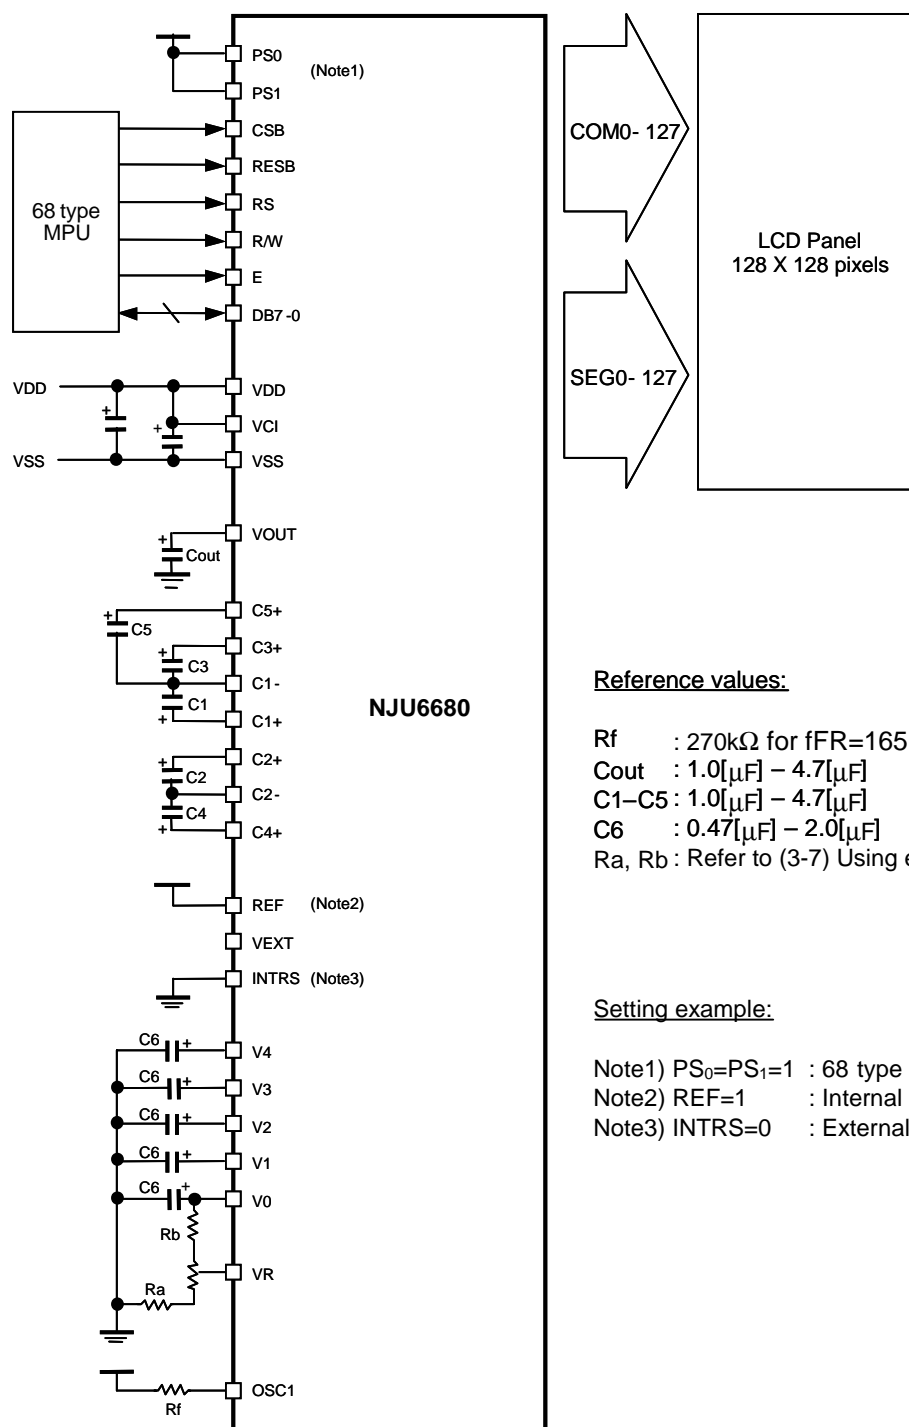

Note 15) SPI clock tolerance is  $\pm 2ppm$ .

■ LCD Driving Wave Form (Black & White Mode)

## APPLICATION CIRCUIT

Example for the application circuits in using the internal power circuits (VC=VR=VF=1)

### Reference values:

$R_f$  : 270k $\Omega$  for  $f_{FR}=165\text{Hz}(\text{typ.})$   
 $C_{out}$  : 1.0[ $\mu\text{F}$ ] – 4.7[ $\mu\text{F}$ ]  
 $C1-C5$  : 1.0[ $\mu\text{F}$ ] – 4.7[ $\mu\text{F}$ ]  
 $C6$  : 0.47[ $\mu\text{F}$ ] – 2.0[ $\mu\text{F}$ ]  
 $R_a, R_b$  : Refer to (3-7) Using external  $R_a$  and  $R_b$  resistors

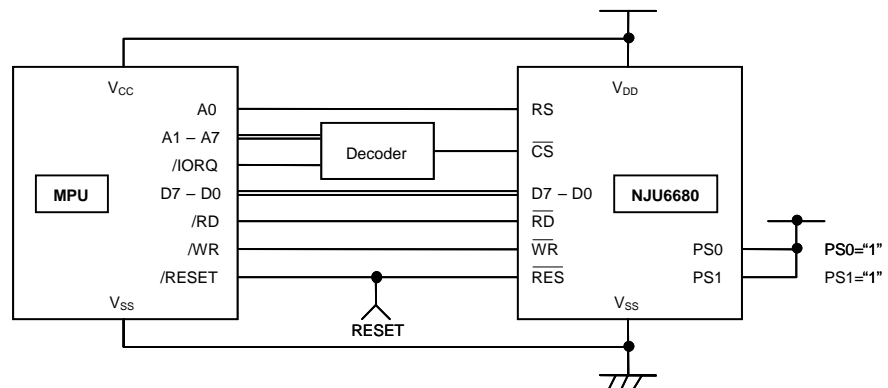

### Setting example:

Note1)  $PS_0=PS_1=1$  : 68 type MPU interface  
 Note2)  $REF=1$  : Internal reference voltage  
 Note3)  $INTRS=0$  : External  $R_a$  and  $R_b$  resistors

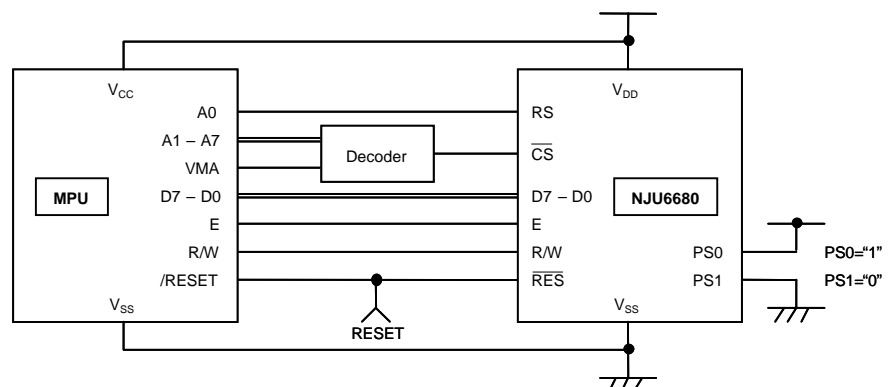

Fig.16

## • MPU Interface Example

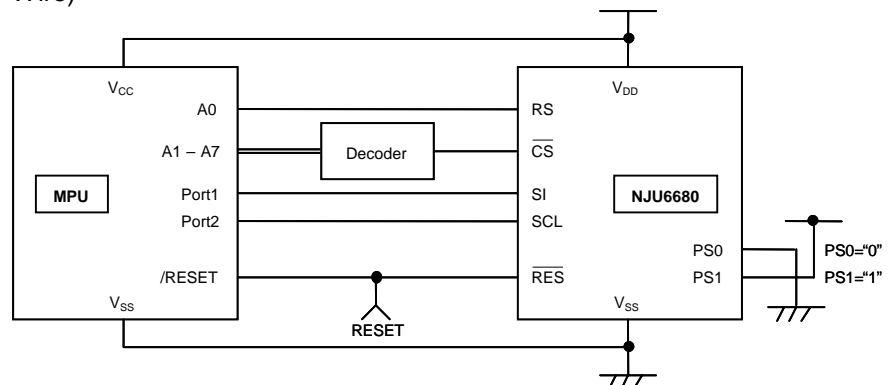

### • 80 type MPU

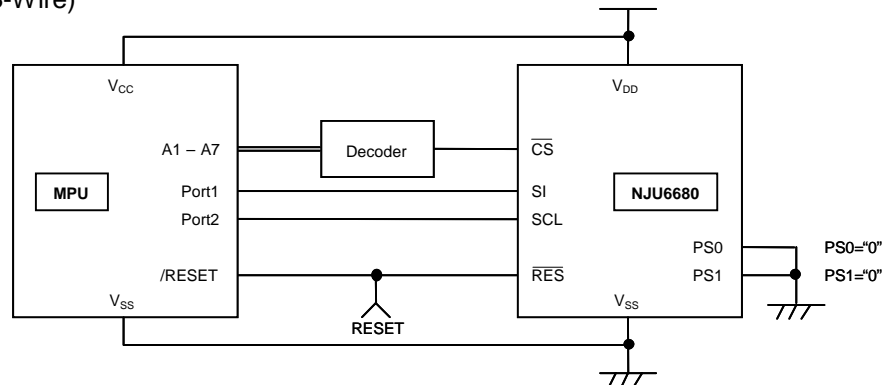

### • 68 type MPU

### • Serial Interface (4-Wire)

### • Serial Interface (3-Wire)

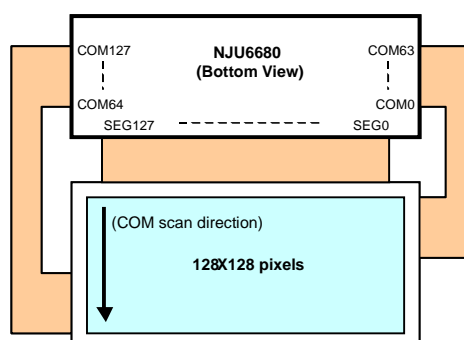

• Connections between the LSI and LCD panel

(1) ADC=0, COM scan direction=0

(2) ADC=1, COM scan direction=0

(3) ADC=1, COM scan direction=1

(4) ADC=0, COM scan direction=1
