

## LM2792

# Current Regulated Switched Capacitor LED Driver with Analog Brightness Control

## General Description

The LM2792 is a CMOS charge-pump voltage doubler and regulator that provides two regulated current sources. They are designed to drive two white (or blue) LEDs with matched currents (within  $\pm 0.3\%$ ) to produce balanced light sources for display backlights. The LM2792 accepts an input voltage range from 3.0V to 5.8V and maintain a constant current determined by an external set resistor.

The LM2792 delivers up to 34mA of load current to accommodate two high forward voltage (typically white) LEDs. The switching frequency is 900kHz (min.) to keep the conducted noise spectrum away from sensitive frequencies within portable RF devices.

The LM2792 offers full off to maximum current control through the BRGT pin. The output current linearly tracks the BRGT pin voltage. The LM2792 is available in active high or low shutdown versions. The shutdown pin reduces the operating current to 1 $\mu$ A (max.).

The LM2792 is available in a 10 pin leadless leadframe (LLP) CSP package.

## Features

- Output matching of  $\pm 0.3\%$  (typ.)
- Drives up to two LED's
- 3.0V to 5.8V Input Voltage
- Up to 34mA output current
- Soft start limits inrush current
- Analog brightness control
- Separate shutdown input
- Very small solution size and no inductor
- 1.4mA typical operating current
- 1 $\mu$ A (max.) shutdown current
- 900kHz switching frequency (min.)
- Linear regulation generates predictable noise spectrum
- LLP-10 package: 3mm X 3mm X 0.8mm

## Applications

- White LED Display Backlights
- White LED Keypad Backlights
- 1-Cell Li-Ion battery-operated equipment including PDAs, hand-held PCs, cellular phones
- Flat Panel Dispalys

## Basic Application Circuit

## Pin Description

Pin	Name	Function
1	BRGT	Variable voltage input controls output current.
2	P <sub>OUT</sub>	Charge pump output.
3	C1–	Connect this pin to the negative terminal of C1.
4	C1+	Connect this pin to the positive terminal of C1.
5	D2	Current source outputs. Connect directly to LED.
6	D1	Current source outputs. Connect directly to LED.
7	GND	Power supply ground input.
8	V <sub>IN</sub>	Power supply voltage input.
9	SD/ $\overline{\text{SD}}$	Shutdown input. Device operation is inhibited when pin is asserted.
10	I <sub>SET</sub>	Current Sense Input. Connect resistor to ground to set constant current through LED.

## Circuit Description

The LM2792 provides two matched current sources for driving high forward voltage drop LEDs from Li-Ion battery sources. The part has on-chip current regulators which are composed of current mirrors with a 25 to 1 ratio. The mirrors control the LED current without using current limiting resistors in the LED current path. The device can drive up to 34mA through the Leds.

The LED brightness can be controlled by both analog and/or digital methods. The digital technique uses a PWM (Pulse Width Modulation) signal applied to the shutdown input. The analog technique applies an analog voltage to the brightness (BRGT) pin (see Application Information section).

20024204

FIGURE 1.

## Application Information

### SOFT START

LM2792 includes a soft start function to reduce the inrush currents and high peak current during power up of the device. Soft start is implemented internally by ramping the bandgap more slowly than the applied voltage. This is done by holding the bandgap in shutdown for a short time. During soft start, the switch resistances limit the inrush current used to charge the flying and hold capacitors.

### SHUTDOWN MODE

A shutdown pin ( $\overline{SD}$  or  $\overline{SD}$ ) is available to disable the LM2792 and reduce the quiescent current to 1μA maximum. The LM2792 is available with both senses of shutdown polarity.

During normal operation mode of the '-L' options, an active high logic signal to the  $\overline{SD}$  pin or tying the  $\overline{SD}$  pin to  $V_{IN}$ , will enable the device. Pulling  $\overline{SD}$  low or connecting  $\overline{SD}$  to ground will disable the device.

During normal operation mode of the '-H' options, an active low logic signal to the SD pin or tying the SD pin to GND, will enable the device. Pulling SD high or connecting SD to  $V_{IN}$  will disable the device.

### CAPACITOR SELECTION

Low equivalent series resistance (ESR) capacitors such as X5R or X7R are recommended to be used for  $C_{IN}$ ,  $C_1$ , and  $C_{HOLD}$  for best performance. Ceramic capacitors with less than or equal to 0.3 ohms ESR value are recommended for this application. Table 1 below lists suggested capacitor suppliers for the typical application circuit.

TABLE 1. Low ESR Capacitor Manufactures

MuRata	(800) 831 9172	www.murata.com
Taiyo Yuden	(800) 348 2496	www.t-yuden.com

### SCHOTTKY DIODE SELECTION

A schottky diode (SD1) must be used between  $V_{IN}$  and  $P_{OUT}$  for proper operation. During start-up, the low voltage drop across this diode is used to charge  $C_{OUT}$  and start the oscillator. It is necessary to protect the device from turning-on its own parasitic diode and potentially latching-up. As a result, it is important to select a schottky diode that will carry at least 200mA or higher current to charge the output capacitor during start-up. A schottky diode like 1N5817 can

## Application Information (Continued)

be used for most applications or a surface mount diode such as BAT54-series and MA2J704 can be used to reduce the circuit size. Table 2 below lists suggested schottky diode manufactures.

### LED SELECTION

The LM2792 is designed to drive LEDs with a forward voltage of about 3.0V to 4.0V or higher. The typical and maximum  $V_F$  depends highly on the manufacturer and their technology. Table 3 lists two suggested manufactures and example part numbers. Each supplier makes many LEDs that work well with the LM2792. The LEDs suggested below are in a surface mount package and TOPLED or SIDEVIEW configuration with a maximum forward current of 20mA. These diodes also come in SIDELED or SIDEVIEW configuration and various chromaticity groups. For applications that demand color and brightness matching, care must be taken to select LEDs from the same chromaticity group. Forward current matching is assured over the LED process variations due to the constant current output of the LM2792. For best fit selection for an application, consult the manufacturer for detailed information.

### $I_{SET}$ PIN

An external resistor,  $R_{SET}$ , sets the mirror current that is required to provide a constant current through the LEDs. The current through  $R_{SET}$  and the LED is set by the internal current mirror circuitry with a ratio of 25:1. The currents through each LED are matched within 0.3%.  $R_{SET}$  should be chosen not to exceed the maximum current delivery capability of the device. Table 3 shows a list of  $R_{SET}$  values when maximum BRGT=3V is applied. For other BRGT voltages,  $R_{SET}$  can be calculated using this formula:

$$R_{SET} = ((0.42 * BRGT) / I_{SET}) * 25$$

**TABLE 4.  $R_{SET}$  Selections ( when BRGT pin = 3V maximum)**

$I_{LED}$ per LED	$R_{SET}$
15mA	2.1K $\Omega$
10mA	3.15K $\Omega$
5mA	6.3K $\Omega$

### BRGT PIN

The BRGT pin can be used to smoothly vary the brightness of the LEDs. In the LM2792, current on BRGT is connected to an internal resistor divider which gives a factor of 0.42 (see Figure 1). This voltage is fed to the operational amplifier that controls the current through the mirror resistor  $R_{SET}$ . The nominal range on BRGT is 0V to 3V.

This means some current must be provided on the BRGT pin or no current will flow through the LEDs. The LM2792 can provide an infinite ratio, from fully off (essentially zero current) to the maximum current set by the  $R_{SET}$  resistor. Care must be taken to prevent voltages on BRGT that cause LED current to exceed a total of 34mA. Although this will not cause damage to the IC, it will not meet the guaranteed specifications listed in the Electrical Characteristics.

#### Calculation of LED Current When Using BRGT :

$$V_{IN} = 3.6V$$

$$R_{SET} = 1800\Omega$$

$$I_{SET} = ((V_{BRGT} * (0.42) / R_{SET}) * 25$$

$$I_{SET} = ((2.75 * (0.42)) / 1800) * 25 = 16mA$$

Note that making  $V_{BRGT} = 0V$  results in  $I_{SET} \sim 0mA$

### BRIGHTNESS CONTROL USING PWM

Brightness control can be implemented by pulsing a signal at the SD pin. The recommended signal should be between 100Hz to 1kHz. If the operating PWM frequency is much less than 100Hz, flicker may be seen in the LEDs. Likewise, if frequency is much higher, brightness in the LEDs will not be linear. When a PWM signal is used to drive the SD pin of the LM2792, connect BRGT pin to a maximum of 3V to ensure the widest range. Similarly, the voltage at the BRGT pin can be set higher than 3V without damage to the IC, it will not increase the brightness of the LED significantly.  $R_{SET}$  value is selected using the above  $I_{SET}$  equation as if BRGT pin is used. The brightness is controlled by increasing and decreasing the duty cycle of the PWM. Zero duty cycle will turn off the brightness and a 50% duty cycle waveform produces an average current of 7.5mA if  $R_{SET}$  is set to produce a maximum LED current of 15mA. So the LED current varies linearly with the duty cycle.

### PARALLEL DX OUTPUTS FOR INCREASED CURRENT DRIVE

Outputs D1 and D2 may be connected together to drive a single LED. In such a configuration, two parallel current sources of equal value drive the single LED.  $R_{SET}$  and  $V_{BRGT}$  should be chosen so that the current through each of the outputs is programmed to 50% of the total desired LED current. For example, if 30mA is the desired drive current for the single LED,  $R_{SET}$  and  $V_{BRGT}$  should be selected so that the current through each of the outputs is 15mA. Connecting the outputs in parallel does not affect internal operation of the LM2792 and has no impact on the Electrical Characteristics and limits previously presented. The available Dx output current, maximum Dx voltage, and all other specifications provided in the Electrical Characteristics table apply to this parallel output configuration, just as they do to the standard 2-LED application circuit.

### THERMAL PROTECTION

The LM2792 has internal thermal protection circuitry to disable the charge pump if the junction temperature exceeds 150°C. This feature will protect the device from damage due to excessive power dissipation. The device will recover and operate normally when the junction temperature falls below the maximum operating junction temperature of 100°C. It is

## Application Information (Continued)

important to have good thermal conduction with a proper layout to reduce thermal resistance.

### POWER EFFICIENCY

An ideal power efficiency for a voltage doubler switched capacitor converter is given as the output voltage of the doubler over twice the input voltage as follows:

$$\text{Efficiency} = (V_{\text{DIODE}} * I_{\text{DIODE}}) / (V_{\text{IN}} * I_{\text{DIODE}} * \text{Gain}) = V_{\text{DIODE}} / 2V_{\text{IN}}$$

In the case of the LM2792, a more accurate efficiency calculation can be applied as the given formula below.

$$\text{Efficiency} = ((V_{\text{D1}} * I_{\text{D1}}) + (V_{\text{D2}} * I_{\text{D2}})) / (I_{\text{SUPPLY}} * V_{\text{IN}})$$

It is clear that the efficiency will depend on the supply voltage in the above equation. As such, the lower the supply voltage, the higher the efficiency.

### POWER DISSIPATION

The maximum allowable power dissipation that this package is capable of handling can be determined as follows:

$$P_{\text{DMax}} = (T_{\text{JMax}} - T_{\text{A}}) / \theta_{\text{JA}}$$

where  $T_{\text{JMax}}$  is the maximum junction temperature,  $T_{\text{A}}$  is the ambient temperature, and  $\theta_{\text{JA}}$  is the junction-to-ambient thermal resistance of the specified package.

The actual power dissipation of the device can be calculated using this equation:

$$P_{\text{Dissipation}} = (2V_{\text{IN}} - V_{\text{DIODE}}) * I_{\text{LOAD}}$$

As an example, if  $V_{\text{IN}}$  in the target application is 4.2V,  $V_{\text{DIODE}} = 3.0\text{V}$  and worst case current consumption is 32mA (17mA for each diode).

$$P_{\text{Dissipation}} = ((2 * 4.2) - 3.0) * 0.032 = 173\text{mW}$$

Power dissipation must be less than that allowed by the package. Please refer to the Absolute Maximum Rating of the LM2792.

### PCB LAYOUT CONSIDERATIONS

The LLP is a leadframe based Chip Scale Package (CSP) with very good thermal properties. This package has an exposed DAP (die attach pad) at the center of the package measuring 2.0mm x 1.2mm. The main advantage of this exposed DAP is to offer lower thermal resistance when it is soldered to the thermal land on the PCB. For PCB layout, National highly recommends a 1:1 ratio between the package and the PCB thermal land. To further enhance thermal conductivity, the PCB thermal land may include vias to a ground plane. For more detailed instructions on mounting LLP packages, please refer to National Semiconductor Application Note AN-1187.

## LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
