## ■ Description for Use

(Pin No. in the following text are for the AN8812SC. For the AN8812SCR, refer to the block diagram.)

### • Driver Portion

Calculate the driver gain by using the following formula for setting.

$$G = \frac{60k\Omega}{R_{IN1} + 100 (\Omega)} \times 2$$

The power supply for Ch.1 and 2 is supplied from Pin27 and the power supply for Ch.3 and 4 is supplied from Pin16 independently.

Output amplitude is increased by increasing the supply voltage. Set the power supply voltage as necessary. However, always set Pin 14 of  $V_{CC}$  to the maximum electric potential.

Pins15 and 28 may require a capacitor for ripple removal.

As protection functions,  $V_{CC}$  reset circuit,  $V_{REF}$  detector and heat protection circuit are incorporated.

The  $V_{CC}$  reset circuit operates at approx. 3V and is released at 3.2V, when the supply (Pin14) decreases. For the  $V_{REF}$  detector, the protection function works at approx. 1V (max. 2V).

Also, the set temperature for operation of the heat protection circuit is approx. 180°C.

In Ch.1 and 2, independently controllable PC (Power Cut) functions are incorporated respectively.

### • 5V Supply

By adding the external PNP transistor, 5V regulator can be constructed. Attach an external capacitor for loop filter to Output Pin10.

In Pin9, the base current limiting circuit (typ. 10mA) is incorporated.

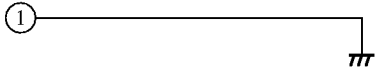

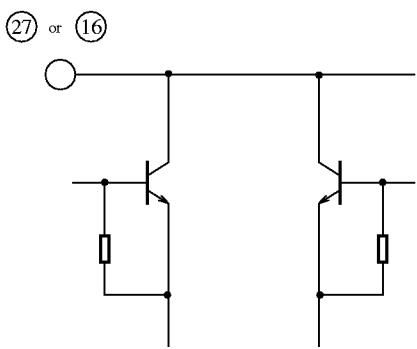

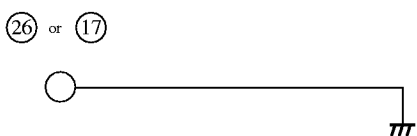

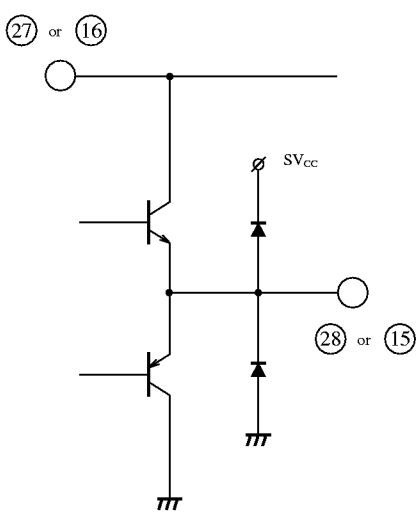

When 5V supply is used, the external PNP Tr emitter must be connected to Pin14 ( $V_{CC}$  pin).

### • Operational Amplifier

When the operational amplifier is not used, make connection as follows :

- (1) Load current,  $I_{P1}$  flowing in loads  $R_{L1}$  and  $R_{L2}$  is supplied through Pin27.

$$I_{P1} = \frac{|V_{25} - V_{24}|}{R_{L1}} + \frac{|V_{23} - V_{22}|}{R_{L2}}$$
