Octal transceiver with 8-bit parity generator/checker

74F657

FEATURES

- Combines 74F245 and 74F280A functions in one package
- High impedance base input for reduced loading (70µA in high and low states)
- Ideal in applications where high output drive and light bus loading are required (I_{IL} is 70µA vs FAST std of 600µA)
- 3-state buffer outputs sink 64mA and source 15mA
- Input diodes for termination effects
- 24-pin plastic slim DIP (300mil) package
- Industrial temperature range available (−40°C to +85°C)

DESCRIPTION

The 74F657 is an octal transceiver featuring non-inverting buffers with 3-state outputs and an 8-bit parity generator/checker, and is intended for bus-oriented applications. The buffers have a guaranteed current sinking capability of 24mA at the A ports and 64mA at the B ports. The transmit/receive (T/R) input determines the direction of the data flow through the bidirectional transceivers. Transmit (active high) enables data from A ports to B ports; receive (active low) enables data from B ports to A ports. The output enable (\overline{OE}) input disables both the A and B ports by placing them in a high impedance condition when the \overline{OE} input is high.

The parity select ($\overline{ODD/EVEN}$) input gives the user the option of odd or even parity systems.

The parity (PARITY) pin is an output from the generator/checker when transmitting from the port A to B ($T/R = \text{high}$) and an input when receiving from port B to A port ($T/R = \text{low}$).

When transmitting ($T/R = \text{high}$) the parity select ($\overline{ODD/EVEN}$) input is set, then the A port data is polled to determine the number of high bits. The parity (PARITY) output then goes to the logic state determined by the parity select ($\overline{ODD/EVEN}$) setting and by the number of high bits on port A.

For example, if the parity select ($\overline{ODD/EVEN}$) is set low (even parity), and the number of high bits on port A is odd, then the parity (PARITY) output will be high, transmitting even parity. If the number of high bits on port A is even, then the parity (PARITY) output will be low, keeping even parity.

When in receive mode ($T/R = \text{low}$) the B port is polled to determine the number of high bits. If parity select ($\overline{ODD/EVEN}$) is low (even parity) and the number of highs on port B is:

(1) odd and the parity (PARITY) input is high, then \overline{ERROR} will be high, significantly no error.

(2) even and the parity (PARITY) input is high, then \overline{ERROR} will be asserted low, indicating an error.

		I _{CCZ}					98	145	mA	

Notes to DC electrical characteristics

- For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
- All typical values are at V_{CC} = 5V, T_{amb} = 25°C.
- Not more than one output should be shorted at a time. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
- For commercial range.
- For industrial range.

Note to AC electrical characteristics

1. These delay times reflect the 3-state recovery time only and not the signal through the buffers or the parity check circuitry. To assure **VALID** information at the **ERROR** pin, time must be allowed for the signal to propagate through the drivers (B to A), through the parity check circuitry (same as A to PARITY), and to the **ERROR** output. **VALID** data at the **ERROR** pin \geq (B to A) + (A to PARITY).

AC WAVEFORMS

Waveform 1. Propagation delay for inverting outputs

Waveform 2. Propagation delay for non-inverting outputs

Waveform 3. 3-state output enable time to high level and output disable time from high level

Waveform 4. 3-state output enable time to low level and output disable time from low level

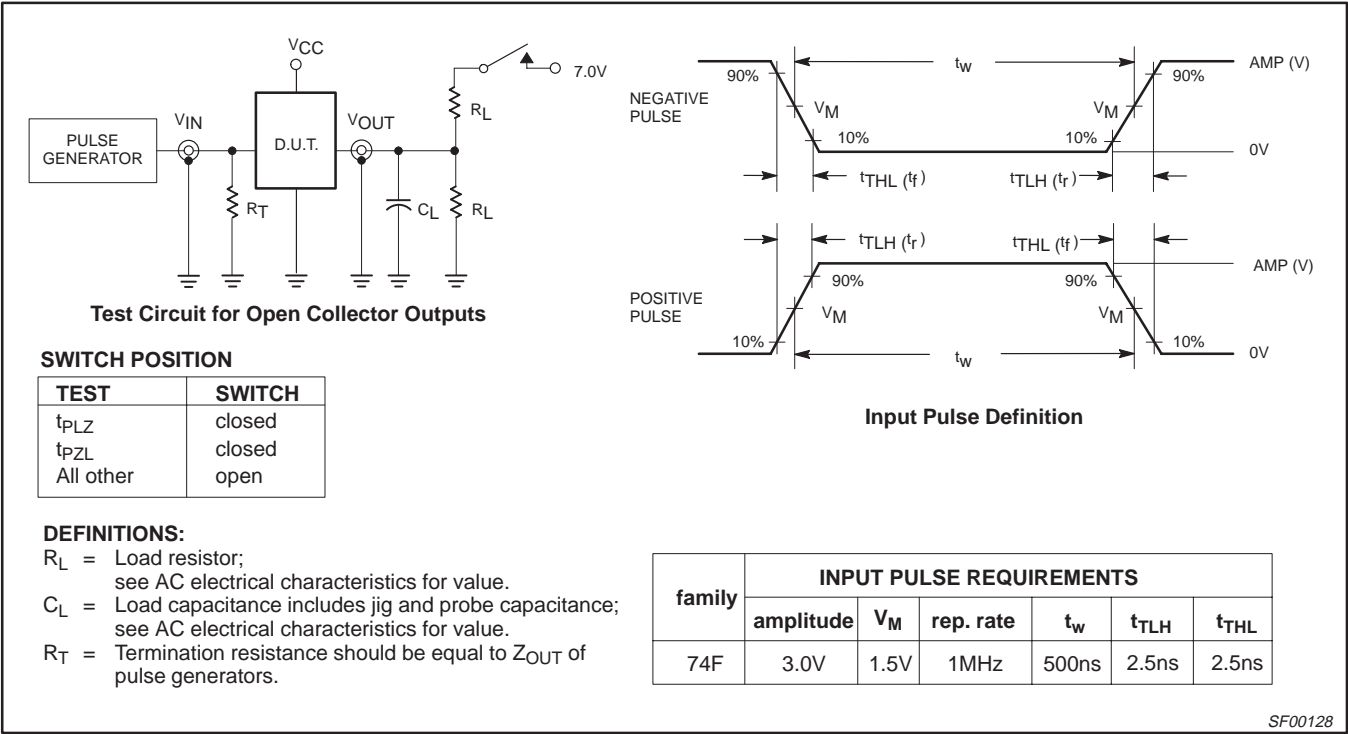

Note to AC waveforms

1. For all waveforms, $V_M = 1.5\text{V}$.

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Disclaimers

Life support — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
