74F2952 Registered transceiver, non-inverting (3-State)
 74F2953 Registered transceiver, inverting (3-State)

FEATURES

- 8-bit registered transceivers
- Two 8-bit, back-to-back registers store data moving in both directions between two bidirectional buses
- Separate Clock, Clock Enable and 3-State Enable provided for each register
- 74F2952 non-inverting
- 74F2953 inverting
- AM2952/2953 functional equivalent
- 'A' outputs sink 24mA and source 3mA
- 'B' outputs sink 64mA and source 15mA
- 300 mil wide 24-pin Slim DIP package

DESCRIPTION

The 74F2952 and 74F2953 are 8-bit registered transceivers. Two 8-bit back-to-back registers store data flowing in both directions between two bi-directional buses. Data applied to the inputs is entered and stored on the rising edge of the Clock (CPXX) provided that the Clock Enable ($\overline{\text{CEXX}}$) is Low. The data is then present at the 3-State output buffers, but is only accessible when the Output Enable ($\overline{\text{OEXX}}$) is Low. Data flow from 'A' inputs to 'B' outputs is the same as for 'B' inputs to 'A' outputs.

NOTES:

- For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
- All typical values are at $V_{CC} = 5\text{V}$, $T_{amb} = 25^\circ\text{C}$.
- Not more than one output should be shorted at a time. For testing I_{OS} , the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
