

To all our customers

Regarding the change of names mentioned in the document, such as Hitachi Electric and Hitachi XX, to Renesas Technology Corp.

The semiconductor operations of Mitsubishi Electric and Hitachi were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Hitachi, Hitachi, Ltd., Hitachi Semiconductors, and other Hitachi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Renesas Technology Home Page: <http://www.renesas.com>

Renesas Technology Corp.
Customer Support Dept.
April 1, 2003

Cautions

Keep safety first in your circuit designs!

1. Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage.

Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
2. Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors.
Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (<http://www.renesas.com>).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.

HD404449 Series

Rev. 6.0
Sept. 1998

Description

The HD404449 Series is a HMCS400-series microcomputer designed to increase program productivity with large-capacity memory. Each microcomputer has four timers, two serial interfaces, A/D converter, input capture circuit, 32-kHz oscillator for clock, and four low-power dissipation modes.

The HD404449 Series includes three chips: the HD404448 with 8-kword ROM; the HD404449 with 16-kword ROM; and HD4074449 with 16-kword PROM (ZTAT™ version).

The HD4074449 is a PROM version (ZTAT™ microcomputer). A program can be written to the PROM by a PROM writer, which can dramatically shorten system development periods and smooth the process from debugging to mass production. (The ZTAT™ version is 27256-compatible.)

ZTAT™: Zero Turn Around Time ZTAT is a trademark of Hitachi Ltd.

Features

- 8,192-word × 10-bit ROM (HD404448)
16,384-word × 10-bit ROM (HD404449 and HD4074449)
- 1,152-digit × 4-bit RAM
- 64 I/O pins, including 10 high-current pins (15 mA, max)
- Four timer/counters
- Eight-bit input capture circuit
- Three timer outputs (including two PWM outputs)
- Two event counter inputs (including one double-edge function)
- Two clock-synchronous 8-bit serial interfaces
- A/D converter (4-channel × 8-bit)
- Built-in oscillators
 - Main clock: 4-MHz ceramic oscillator or crystal (an external clock is also possible)
 - Subclock: 32.768-kHz crystal
- Eleven interrupt sources
 - Four by external sources, including two double-edge function
 - Seven by internal sources

HD404449 Series

- Subroutine stack up to 16 levels, including interrupts
- Four low-power dissipation modes
 - Subactive mode
 - Standby mode
 - Watch mode
 - Stop mode
- One external input for transition from stop mode to active mode
- Instruction cycle time: 1 μ s ($f_{OSC} = 4$ MHz)
- Two operating modes
 - MCU mode (HD404448, HD404449)
 - MCU/PROM mode (HD4074449)

Ordering Information

Pin Arrangement

HD404449 Series

Pin Description

Item	Symbol	Pin Number	I/O	Function
Power supply	V _{CC}	77		Applies power voltage
	GND	10		Connected to ground
Test	$\overline{\text{TEST}}$	4	I	Used for factory testing only: Connect this pin to V _{CC}
Reset	RESET	7	I	Resets the MCU
Oscillator	OSC ₁	5	I	Input/output pins for the internal oscillator circuit: Connect them to a ceramic oscillator, crystal, or connect OSC ₁ to an external oscillator circuit
	OSC ₂	6	O	
	X1	8	I	Used for a 32.768-kHz crystal for clock purposes. If not to be used, fix the X1 pin to V _{CC} and leave the X2 pin open.
	X2	9	O	
Port	D ₀ –D ₁₁	11–22	I/O	Input/output pins addressed by individual bits; pins D ₀ –D ₉ are high-current pins that can each supply up to 15 mA
	D ₁₂ , D ₁₃	23, 24	I	Input pins addressable by individual bits
	R0 ₀ –RC ₃	25–76	I/O	Input/output pins addressable in 4-bit units
Interrupt	$\overline{\text{INT}}_0$, $\overline{\text{INT}}_1$, INT ₂ , INT ₃	24–27	I	Input pins for external interrupts
Stop clear	$\overline{\text{STOPC}}$	23	I	Input pin for transition from stop mode to active mode
Serial	$\overline{\text{SCK}}_1$, $\overline{\text{SCK}}_2$	42, 46	I/O	Serial clock input/output pin
interface	SI ₁ , SI ₂	43, 47	I	Serial receive data input pin
	SO ₁ , SO ₂	44, 48	O	Serial transmit data output pin
Timer	TOB, TOC, TOD	37–39	O	Timer output pins
	EVNB, EVND	40, 41	I	Event count input pins
A/D converter	AV _{CC}	78		Power pin for A/D converter: Connect it to the same potential as V _{CC} , as physically close to the V _{CC} pin as possible
	AV _{SS}	3		Ground for AV _{CC} : Connect it to the same potential as GND, as physically close to the GND pin as possible
	AN ₀ –AN ₃	79, 80, 1, 2	I	Analog input pins for A/D converter

Block Diagram

Memory Map

ROM Memory Map

The ROM memory map is shown in figure 1 and described below.

Figure 1 ROM Memory Map

Vector Address Area (\$0000–\$000F): Reserved for JMPL instructions that branch to the start addresses of the reset and interrupt routines. After MCU reset or an interrupt, program execution continues from the vector address.

Zero-Page Subroutine Area (\$0000–\$003F): Reserved for subroutines. The program branches to a subroutine in this area in response to the CAL instruction.

Pattern Area (\$0000–\$0FFF): Contains ROM data that can be referenced with the P instruction.

Program Area (\$0000–\$1FFF (HD404448), \$0000–\$3FFF (HD404449, HD4074449)): Used for program coding.

RAM Memory Map

The MCU contains a 1,152-digit \times 4-bit RAM area consisting of a memory register area, a data area, and a stack area. In addition, an interrupt control bits area, special register area, and register flag area are mapped onto the same RAM memory space as a RAM-mapped register area outside the above areas. The RAM memory map is shown in figure 2 and described as follows.

Figure 2 RAM Memory Map

HD404449 Series

RAM-Mapped Register Area (\$000–\$03F):

- Interrupt Control Bits Area (\$000–\$003)

This area is used for interrupt control bits (figure 3). These bits can be accessed only by RAM bit manipulation instructions (SEM/SEMD, REM/REMD, and TM/TMD). However, note that not all the instructions can be used for each bit. Limitations on using the instructions are shown in figure 4.

- Special Function Register Area (\$004–\$01F, \$024–\$03F)

This area is used as mode registers and data registers for external interrupts, serial interface 1, serial interface 2, timer/counters, A/D converter, and as data control registers for I/O ports. The structure is shown in figures 2 and 5. These registers can be classified into three types: write-only (W), read-only (R), and read/write (R/W). RAM bit manipulation instructions cannot be used for these registers.

- Register Flag Area (\$020–\$023)

This area is used for the DTON, WDON, and other register flags and interrupt control bits (figure 3). These bits can be accessed only by RAM bit manipulation instructions (SEM/SEMD, REM/REMD, and TM/TMD). However, note that not all the instructions can be used for each bit. Limitations on using the instructions are shown in figure 4.

Memory Register (MR) Area (\$040–\$04F): Consisting of 16 addresses, this area (MR0–MR15) can be accessed by register-register instructions (LAMR and XMRA). The structure is shown in figure 6.

Data Area (\$090–\$2EF): 464 digits from \$090 to \$25F have two banks, which can be selected by setting the bank register (V: \$03F). Before accessing this area, set the bank register to the required value (figure 7). The area from \$260 to \$2EF is accessed without setting the bank register.

Stack Area (\$3C0–\$3FF): Used for saving the contents of the program counter (PC), status flag (ST), and carry flag (CA) at subroutine call (CAL or CALL instruction) and for interrupts. This area can be used as a 16-level nesting subroutine stack in which one level requires four digits. The data to be saved and the save conditions are shown in figure 6.

The program counter is restored by either the RTN or RTNI instruction, but the status and carry flags can only be restored by the RTNI instruction. Any unused space in this area is used for data storage.

	Bit 3	Bit 2	Bit 1	Bit 0

Figure 6 Configuration of Memory Registers and Stack Area, and Stack Position

Figure 7 Bank Register (V)

Functional Description

Registers and Flags

The MCU has nine registers and two flags for CPU operations. They are shown in figure 8 and described below.

Figure 8 Registers and Flags

Accumulator (A), B Register (B): Four-bit registers used to hold the results from the arithmetic logic unit (ALU) and transfer data between memory, I/O, and other registers.

W Register (W), X Register (X), Y Register (Y): Two-bit (W) and four-bit (X and Y) registers used for indirect RAM addressing. The Y register is also used for D-port addressing.

HD404449 Series

SPX Register (SPX), SPY Register (SPY): Four-bit registers used to supplement the X and Y registers.

Carry Flag (CA): One-bit flag that stores any ALU overflow generated by an arithmetic operation. CA is affected by the SEC, REC, ROTL, and ROTR instructions. A carry is pushed onto the stack during an interrupt and popped from the stack by the RTNI instruction—but not by the RTN instruction.

Status Flag (ST): One-bit flag that latches any overflow generated by an arithmetic or compare instruction, not-zero decision from the ALU, or result of a bit test. ST is used as a branch condition of the BR, BRL, CAL, and CALL instructions. The contents of ST remain unchanged until the next arithmetic, compare, or bit test instruction is executed, but become 1 after the BR, BRL, CAL, or CALL instruction is read, regardless of whether the instruction is executed or skipped. The contents of ST are pushed onto the stack during an interrupt and popped from the stack by the RTNI instruction—but not by the RTN instruction.

Program Counter (PC): 14-bit binary counter that points to the ROM address of the instruction being executed.

Stack Pointer (SP): Ten-bit pointer that contains the address of the stack area to be used next. The SP is initialized to \$3FF by MCU reset. It is decremented by 4 when data is pushed onto the stack, and incremented by 4 when data is popped from the stack. The top four bits of the SP are fixed at 1111, so a stack can be used up to 16 levels.

The SP can be initialized to \$3FF in another way: by resetting the RSP bit with the REM or REMD instruction.

Reset

The MCU is reset by inputting a high-level voltage to the RESET pin. At power-on or when stop mode is cancelled, RESET must be high for at least one t_{RC} to enable the oscillator to stabilize. During operation, RESET must be high for at least two instruction cycles.

Initial values after MCU reset are listed in table 1.

Table 1 Initial Values After MCU Reset

Item	Abbr.	Initial Value	Contents
Program counter	(PC)	\$0000	Indicates program execution point from start address of ROM area
Status flag	(ST)	1	Enables conditional branching
Stack pointer	(SP)	\$3FF	Stack level 0
Interrupt flags/mask	Interrupt enable flag	(IE) 0	Inhibits all interrupts
	Interrupt request flag	(IF) 0	Indicates there is no interrupt request
	Interrupt mask	(IM) 1	Prevents (masks) interrupt requests
I/O	Port data register	(PDR) All bits 1	Enables output at level 1
	Data control register	(DCD0–DCD2) All bits 0	Turns output buffer off (to high impedance)
		(DCR0–DCRC) All bits 0	
	Port mode register A	(PMRA) 0000	Refer to description of port mode register A
	Port mode register B	(PMRB) - 000	Refer to description of port mode register B
	Port mode register C	(PMRC) 0000	Refer to description of port mode register C
	Detection edge select register 1	(ESR1) 0000	Disables edge detection
	Detection edge select register 2	(ESR2) 00 - -	Disables edge detection
	Timer mode register A	(TMA) 0000	Refer to description of timer mode register A
Timer/ counters, serial interface	Timer mode register B1	(TMB1) 0000	Refer to description of timer mode register B1

	System clock select register bits 2–0	(SSR2– SSR0)	00 -	Refer to description of operating modes, and oscillator circuit
	Bank register	(V)	- - - 0	Refer to description of RAM memory map

Notes: 1. The statuses of other registers and flags after MCU reset are shown in the following table.
2. X indicates invalid value. — indicates that the bit does not exist.

Item	Abbr.	Status After Cancellation of Stop Mode by STOPC Input	Status After Cancellation of Stop Mode by MCU Reset	Status After all Other Types of Reset
Carry flag	(CA)	Pre-stop-mode values are not guaranteed; values must be initialized by program		Pre-stop-mode values are not guaranteed; values must be initialized by program
Accumulator	(A)			
B register	(B)			
W register	(W)			
X/SPX register	(X/SPX)			
Y/SPY register	(Y/SPY)			
Serial data register	(SRL, SRU)			
A/D data register	(ADRL, ADRU)			
RAM		Pre-stop-mode values are retained		
RAM enable flag	(RAME)	1	0	0
Port mode register 1 bit 2	(PMRC12)	Pre-stop-mode values are retained	0	0
System clock select register bit 3	(SSR3)			

Interrupts

The MCU has 11 interrupt sources: four external signals ($\overline{\text{INT}}_0$, $\overline{\text{INT}}_1$, INT_2 , INT_3), four timer/counters (timers A, B, C, and D), two serial interfaces (serial 1, serial 2), and A/D converter.

An interrupt request flag (IF), interrupt mask (IM), and vector address are provided for each interrupt source, and an interrupt enable flag (IE) controls the entire interrupt process.

Some vector addresses are shared by two different interrupts. They are timer B and INT_2 , timer C and INT_3 , timer D and A/D converter, and serial interface 1 and serial interface 2. So the type of request that has occurred must be checked at the beginning of interrupt processing.

Interrupt Control Bits and Interrupt Processing: Locations \$000 to \$003 and \$022 to \$023 in RAM are reserved for the interrupt control bits which can be accessed by RAM bit manipulation instructions.

The interrupt request flag (IF) cannot be set by software. MCU reset initializes the interrupt enable flag (IE) and the IF to 0 and the interrupt mask (IM) to 1.

A block diagram of the interrupt control circuit is shown in figure 9, interrupt priorities and vector addresses are listed in table 2, and interrupt processing conditions for the 11 interrupt sources are listed in table 3.

HD404449 Series

An interrupt request occurs when the IF is set to 1 and the IM is set to 0. If the IE is 1 at that point, the interrupt is processed. A priority programmable logic array (PLA) generates the vector address assigned to that interrupt source.

The interrupt processing sequence is shown in figure 10 and an interrupt processing flowchart is shown in figure 11. After an interrupt is acknowledged, the previous instruction is completed in the first cycle. The IE is reset in the second cycle, the carry, status, and program counter values are pushed onto the stack during the second and third cycles, and the program jumps to the vector address to execute the instruction in the third cycle.

Program the JMPL instruction at each vector address, to branch the program to the start address of the interrupt program, and reset the IF by a software instruction within the interrupt program.

Table 2 Vector Addresses and Interrupt Priorities

Reset/Interrupt	Priority	Vector Address
RESET, $\overline{\text{STOPC}}$ *	—	\$0000
$\overline{\text{INT}}_0$	1	\$0002
$\overline{\text{INT}}_1$	2	\$0004
Timer A	3	\$0006
Timer B, INT_2	4	\$0008
Timer C, INT_3	5	\$000A
Timer D, A/D	6	\$000C
Serial 1, Serial 2	7	\$000E

Note: * The $\overline{\text{STOPC}}$ interrupt request is valid only in stop mode

Operating Modes

The MCU has five operating modes as shown in table 19. The operations in each mode are listed in tables 20 and 21. Transitions between operating modes are shown in figure 14.

Active Mode: All MCU functions operate according to the clock generated by the system oscillators OSC₁ and OSC₂.

Table 19 Operating Modes and Clock Status

		Mode Name				
		Active	Standby	Stop	Watch	Subactive*²
Activation method		RESET cancellation, interrupt request, <u>STOPC</u> cancellation in stop mode, STOP/SBY instruction in subactive mode (when direct transfer is selected)	SBY instruction	STOP instruction when TMA3 = 0	STOP instruction when TMA3 = 1	$\overline{\text{INT}}_0$ or timer A interrupt request from watch mode
Status	System oscillator	OP	OP	Stopped	Stopped	Stopped
	Subsystem oscillator	OP	OP	OP* ¹	OP	OP
Cancellation method		RESET input, STOP/SBY instruction	RESET input, interrupt request	RESET input, <u>STOPC</u> input in stop mode	RESET input, $\overline{\text{INT}}_0$ or timer A interrupt request	RESET input, STOP/SBY instruction

Note: OP implies in operation

1. Operating or stopping the oscillator can be selected by setting bit 3 of the system clock select register (SSR: \$029).
2. Subactive mode is an optional function; specify it on the function option list.

HD404449 Series

Table 20 Operations in Low-Power Dissipation Modes

Function	Stop Mode	Watch Mode	Standby Mode	Subactive Mode** ²
CPU	Reset	Retained	Retained	OP
RAM	Retained	Retained	Retained	OP
Timer A	Reset	OP	OP	OP
Timer B	Reset	Stopped	OP	OP
Timer C	Reset	Stopped	OP	OP
Timer D	Reset	Stopped	OP	OP
Serial 1, 2	Reset	Stopped* ³	OP	OP
A/D	Reset	Stopped	OP	Stopped
I/O	Reset* ¹	Retained	Retained	OP

Note: OP implies in operation

1. Output pins are at high impedance.
2. Subactive mode is an optional function specified on the function option list.
3. Transmission/reception is activated if a clock is input in external clock mode. However, all interrupts stop.

Table 21 I/O Status in Low-Power Dissipation Modes

	Output		Input
	Standby mode, watch mode	Stop mode	Active mode, subactive mode
D ₀ –D ₁₁	Retained	High impedance	Input enabled
D ₁₂ –D ₁₃	—	—	Input enabled
R0–RC	Retained or output of peripheral functions	High impedance	Input enabled

Figure 14 MCU Status Transitions

HD404449 Series

Standby Mode: In standby mode, the oscillators continue to operate, but the clocks related to instruction execution stop. Therefore, the CPU operation stops, but all RAM and register contents are retained, and the D or R port status, when set to output, is maintained. Peripheral functions such as interrupts, timers, and serial interface continue to operate. The power dissipation in this mode is lower than in active mode because the CPU stops.

The MCU enters standby mode when the SBY instruction is executed in active mode.

Standby mode is terminated by a RESET input or an interrupt request. If it is terminated by RESET input, the MCU is reset as well. After an interrupt request, the MCU enters active mode and executes the next instruction after the SBY instruction. If the interrupt enable flag is 1, the interrupt is then processed; if it is 0, the interrupt request is left pending and normal instruction execution continues. A flowchart of operation in standby mode is shown in figure 15.

Figure 15 MCU Operation Flowchart

Stop Mode: In stop mode, all MCU operations stop and RAM data is retained. Therefore, the power dissipation in this mode is the least of all modes. The OSC₁ and OSC₂ oscillator stops. Operation of the X1 and X2 oscillator can be selected by setting bit 3 of the system clock select register (SSR: \$029; operating: SSR3 = 0, stop: SSR3 = 1) (figure 26). The MCU enters stop mode if the STOP instruction is executed in active mode when bit 3 of timer mode register A (TMA: \$008) is set to 0 (TMA3 = 0) (figure 41).

Stop mode is terminated by a RESET input or a $\overline{\text{STOPC}}$ input as shown in figure 16. RESET or $\overline{\text{STOPC}}$ must be applied for at least one t_{RC} to stabilize oscillation (refer to the AC Characteristics section). When the MCU restarts after stop mode is cancelled, all RAM contents before entering stop mode are retained, but the accuracy of the contents of the accumulator, B register, W register, X/SPX register, Y/SPY register, carry flag, and serial data register cannot be guaranteed.

Figure 16 Timing of Stop Mode Cancellation

Watch Mode: In watch mode, the clock function (timer A) using the X1 and X2 oscillator operates but other function operations stop. Therefore, the power dissipation in this mode is the second least to stop mode, and this mode is convenient when only clock display is used. In this mode, the OSC₁ and OSC₂ oscillator stops, but the X1 and X2 oscillator operates. The MCU enters watch mode if the STOP instruction is executed in active mode when TMA3 = 1, or if the STOP or SBY instruction is executed in subactive mode.

Watch mode is terminated by a RESET input or a timer-A/ $\overline{\text{INT}}_0$ interrupt request. For details of RESET input, refer to the Stop Mode section. When terminated by a timer-A/ $\overline{\text{INT}}_0$ interrupt request, the MCU enters active mode if LSON is 0, or subactive mode if LSON is 1. After an interrupt request is generated, the time required to enter active mode is t_{RC} for a timer A interrupt, and T_X (where $T + t_{\text{RC}} < T_X < 2T + t_{\text{RC}}$) for an $\overline{\text{INT}}_0$ interrupt, as shown in figure 17.

Operation during mode transition is the same as that at standby mode cancellation (figure 15).

Figure 17 Interrupt Frame

Subactive Mode: The OSC_1 and OSC_2 oscillator stops and the MCU operates with a clock generated by the X1 and X2 oscillator. In this mode, functions other than A/D conversion operate. However, because the operating clock is slow, the power dissipation becomes low, next to watch mode.

The CPU instruction execution speed can be selected as 244 μs or 122 μs by setting bit 2 (SSR2) of the system clock select register (SSR: \$029). Note that the SSR2 value must be changed in active mode. If the value is changed in subactive mode, the MCU may malfunction.

When the STOP or SBY instruction is executed in subactive mode, the MCU enters either watch or active mode, depending on the statuses of the low speed on flag (LSON: \$020, bit 0) and the direct transfer on flag (DTON: \$020, bit 3).

Subactive mode is an optional function that the user must specify on the function option list.

Interrupt Frame: In watch and subactive modes, ϕ_{CLK} is applied to timer A and the \overline{INT}_0 circuit. Prescaler W and timer A operate as the time-base and generate the timing clock for the interrupt frame. Three interrupt frame lengths (T) can be selected by setting the miscellaneous register (MIS: \$00C) (figure 18).

In watch and subactive modes, the timer-A/ \overline{INT}_0 interrupt is generated synchronously with the interrupt frame. The interrupt request is generated synchronously with the interrupt strobe timing except during transition to active mode. The falling edge of the \overline{INT}_0 signal is input asynchronously with the interrupt frame timing, but it is regarded as input synchronously with the second interrupt strobe clock after the falling edge. An overflow and interrupt request in timer A is generated synchronously with the interrupt strobe timing.

Figure 18 Miscellaneous Register (MIS)

Direct Transition from Subactive Mode to Active Mode: Available by controlling the direct transfer on flag (DTON: \$020, bit 3) and the low speed on flag (LSON: \$020, bit 0). The procedures are described below:

- Set LSON to 0 and DTON to 1 in subactive mode.
- Execute the STOP or SBY instruction.
- The MCU automatically enters active mode from subactive mode after waiting for the MCU internal processing time and oscillation stabilization time (Figure 19).

Notes: 1. The DTON flag (\$020, bit 3) can be set only in subactive mode. It is always reset in active mode.

2. The transition time (T_D) from subactive mode to active mode:

$$t_{RC} < T_D < T + t_{RC}$$

Figure 19 Direct Transition Timing

Stop Mode Cancellation by $\overline{\text{STOPC}}$: The MCU enters active mode from stop mode by a $\overline{\text{STOPC}}$ input as well as by RESET. In either case, the MCU starts instruction execution from the starting address (address 0) of the program. However, the value of the RAM enable flag (RAME: \$021, bit 3) differs between cancellation by $\overline{\text{STOPC}}$ and by RESET. When stop mode is cancelled by RESET, RAME = 0; when cancelled by $\overline{\text{STOPC}}$, RAME = 1. RESET can cancel all modes, but $\overline{\text{STOPC}}$ is valid only in stop mode; $\overline{\text{STOPC}}$ input is ignored in other modes. Therefore, when the program requires to confirm that stop mode has been cancelled by $\overline{\text{STOPC}}$ (for example, when the RAM contents before entering stop mode are used after transition to active mode), execute the TEST instruction on the RAM enable flag (RAME) at the beginning of the program.

MCU Operation Sequence: The MCU operates in the sequences shown in figures 20 to 22. It is reset by an asynchronous RESET input, regardless of its status.

The low-power mode operation sequence is shown in figure 22. With the IE flag cleared and an interrupt flag set together with its interrupt mask cleared, if a STOP/SBY instruction is executed, the instruction is cancelled (regarded as an NOP) and the following instruction is executed. Before executing a STOP/SBY instruction, make sure all interrupt flags are cleared or all interrupts are masked.

Figure 20 MCU Operating Sequence (Power On)

Figure 21 MCU Operating Sequence (MCU Operation Cycle)

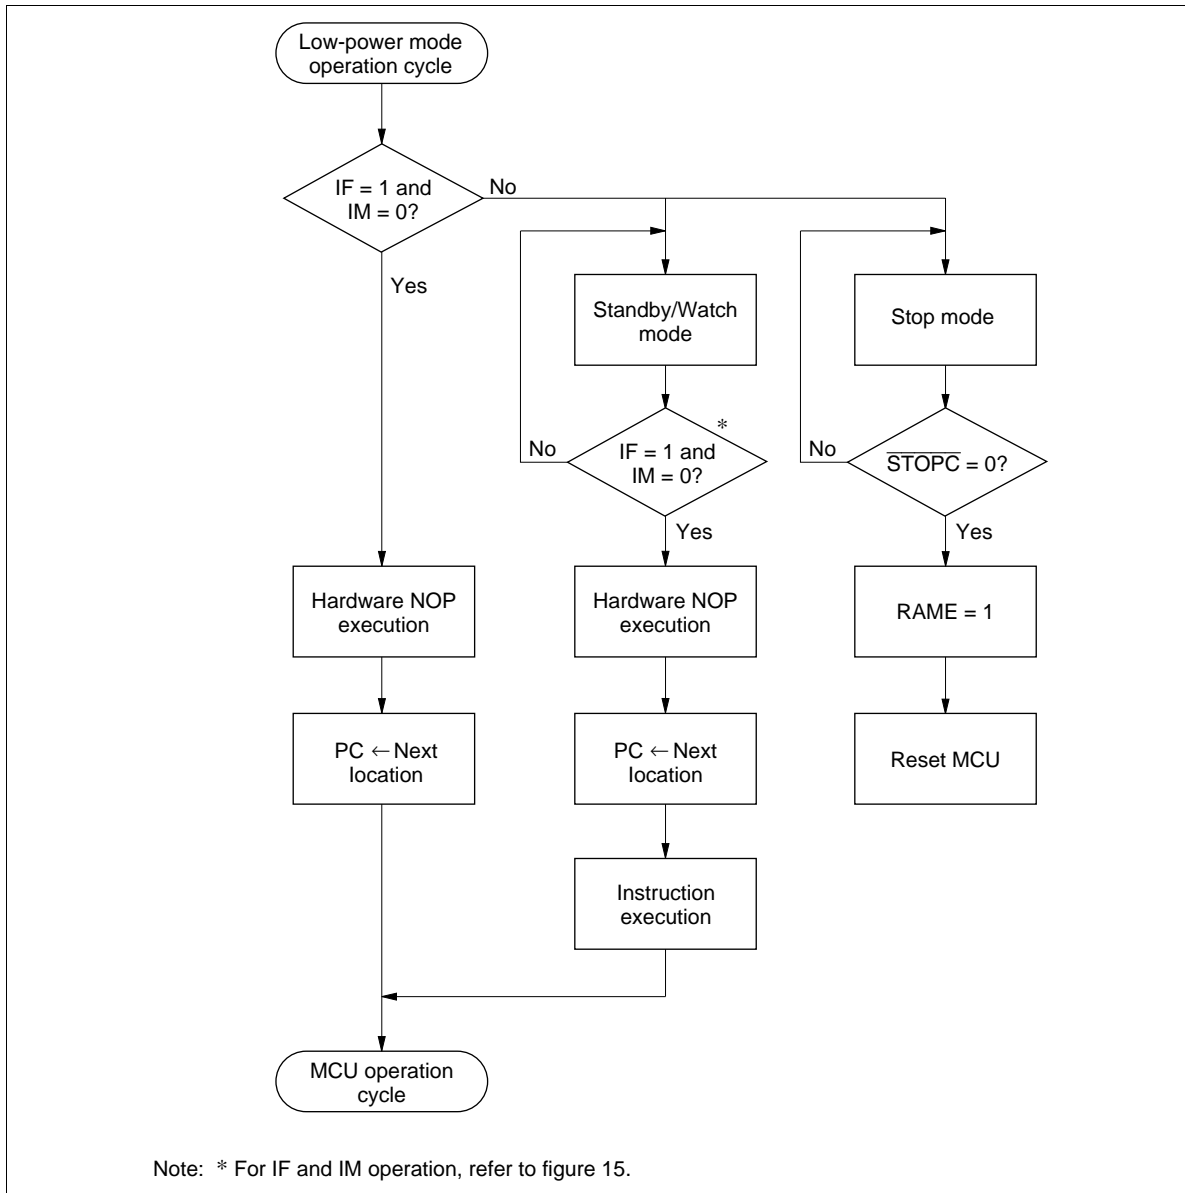

Figure 22 MCU Operating Sequence (Low-Power Mode Operation)

Note: When the MCU is in watch mode or subactive mode, if the high level period before the falling edge of \overline{INT}_0 is shorter than the interrupt frame, \overline{INT}_0 is not detected. Also, if the low level period after the falling edge of \overline{INT}_0 is shorter than the interrupt frame, \overline{INT}_0 is not detected. Edge detection is shown in figure 23. The level of the \overline{INT}_0 signal is sampled by a sampling clock. When this sampled value changes to low from high, a falling edge is detected. In figure 24, the level of the \overline{INT}_0 signal is sampled by an interrupt frame. In (a) the sampled value is low at point A, and also low at point B. Therefore, a falling edge is not detected. In (b), the sampled value is high at point A, and also high at point B. A falling edge is not detected in this case either.

HD404449 Series

When the MCU is in watch mode or subactive mode, keep the high level and low level period of $\overline{\text{INT}}_0$ longer than interrupt frame.

Figure 23 Edge Detection

Figure 24 Sampling Example

Internal Oscillator Circuit

A block diagram of the clock generation circuit is shown in figure 25. As shown in table 22, a ceramic oscillator or crystal oscillator can be connected to OSC₁ and OSC₂, and a 32.768-kHz oscillator can be connected to X1 and X2. The system oscillator can also be operated by an external clock. Bit 1 (SSR1) of the system clock select register (SSR: \$029) must be selected according to the frequency of the oscillator connected to OSC₁ and OSC₂ (figure 26).

Note: If the system clock select register (SSR: \$029) setting does not match the oscillator frequency, subsystems using the 32.768-kHz oscillation will malfunction.

Figure 25 Clock Generation Circuit

Figure 26 System Clock Select Register

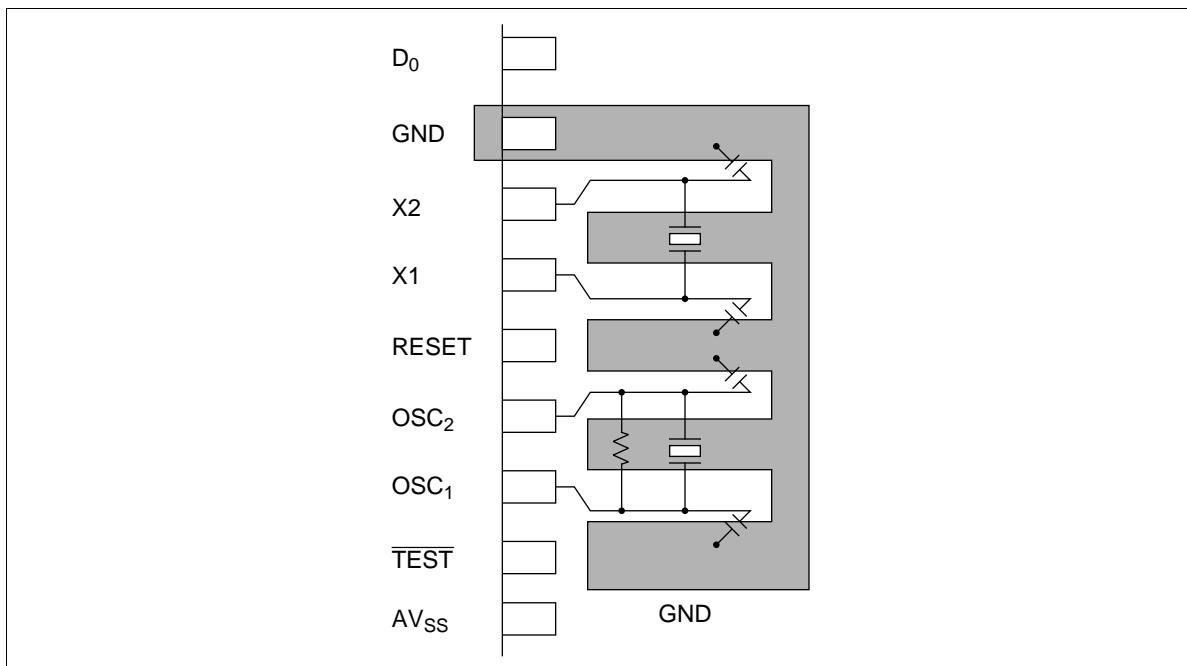

Figure 27 Typical Layouts of Crystal and Ceramic Oscillator

Table 22 Oscillator Circuit Examples

Circuit Configuration	Circuit Constants
<p>External clock operation</p> 	
<p>Ceramic oscillator (OSC₁, OSC₂)</p> 	<p>Ceramic oscillator: CSA4.00MG (Murata)</p> <p>$R_f = 1\text{ M}\Omega \pm 20\%$</p> <p>$C_1 = C_2 = 30\text{ pF} \pm 20\%$</p>
<p>Crystal oscillator (OSC₁, OSC₂)</p> 	<p>$R_f = 1\text{ M}\Omega \pm 20\%$</p> <p>$C_1 = C_2 = 10\text{--}22\text{ pF} \pm 20\%$</p> <p>Crystal: Equivalent to circuit shown below</p> <p>$C_0 = 7\text{ pF max}$</p> <p>$R_s = 100\text{ }\Omega\text{ max}$</p>
<p>Crystal oscillator (X1, X2)</p> 	<p>Ceramic: 32.768 kHz: MX38T (Nippon Denpa Kogyo)</p> <p>$C_1 = C_2 = 20\text{ pF} \pm 20\%$</p> <p>$R_s: 14\text{ k}\Omega$</p> <p>$C_0: 1.5\text{ pF}$</p>

- Notes:
1. Since the circuit constants change depending on the crystal or ceramic resonator and stray capacitance of the board, the user should consult with the crystal or ceramic oscillator manufacturer to determine the circuit parameters.
 2. Wiring among OSC₁, OSC₂, X1, X2, and elements should be as short as possible, and must not cross other wiring (see figure 27).
 3. If the 32.768-kHz crystal oscillator is not used, the X1 pin must be fixed to GND and X2 must be open.

HD404449 Series

Input/Output

The MCU has 64 input/output pins (D_0 – D_{11} , $R0_0$ – RC_3) and 2 input pins (D_{12} , D_{13}). The features are described below.

- 10 pins (D_0 – D_9) are high-current input/output pins.
- The D_{12} , D_{13} , $R0_0$ – $R0_2$, and $R3_0$ – $R5_3$ input/output pins are multiplexed with peripheral function pins such as for the timers or serial interface. For these pins, the peripheral function setting is done prior to the D or R port setting. Therefore, when a peripheral function is selected for a pin, the pin function and input/output selection are automatically switched according to the setting.
- Input or output selection for input/output pins and port or peripheral function selection for multiplexed pins are set by software.
- Peripheral function output pins are CMOS output pins. Only the $R4_3/SO_1$ and $R5_3/SO_2$ pins can be set to NMOS open-drain output by software.
- In stop mode, the MCU is reset, and therefore peripheral function selection is cancelled. Input/output pins are in high-impedance state.
- Each input/output pin has a built-in pull-up MOS, which can be individually turned on or off by software.

I/O buffer configuration is shown in figure 28, programmable I/O circuits are listed in table 23, and I/O pin circuit types are shown in table 24.

Table 23 Programmable I/O Circuits

HD404449 Series

Table 24 Circuit Configurations of I/O Pins

I/O Pin Type	Circuit	Pins
Input/output pins		$D_0-D_{11}, R0_0-R0_3$ $R1_0-R1_3, R2_0-R2_3$ $R3_0-R3_3, R4_0-R4_2$ $R5_0-R5_2, R6_0-R6_3$ $R7_0-R7_3, R8_0-R8_3$ $R9_0-R9_3, RA_0-RA_3$ RB_0-RB_3, RC_0-RC_3
		$R4_3, R5_3$
Input pins		D_{12}, D_{13}
Peripheral Input/ output function pins		SCK_1, SCK_2
Output pins		SO_1, SO_2
		TOB, TOC, TOD

I/O Pin Type	Circuit	Pins
Input pins		$SI_1, SI_2, \overline{INT}_1,$ $INT_2, INT_3,$ $\overline{EVNB}, \overline{EVND}$
		$\overline{INT}_0, \overline{STOPC}$

- Notes: 1. The MCU is reset in stop mode, and peripheral function selection is cancelled. The \overline{HLT} signal becomes low, and input/output pins enter high-impedance state.
2. The \overline{HLT} signal is 1 in watch and subactive modes.

D Port (D_0 – D_{13}): Consist of 12 input/output pins and 2 input pins addressed by one bit. D_0 – D_{11} are high-current I/O pins, and D_{12} and D_{13} are input-only pins.

Pins D_0 – D_{11} are set by the SED and SEDD instructions, and reset by the RED and REDD instructions. Output data is stored in the port data register (PDR) for each pin. All pins D_0 – D_{13} are tested by the TD and TDD instructions.

The on/off statuses of the output buffers are controlled by D-port data control registers (DCD0–DCD2: \$02C–\$02E) that are mapped to memory addresses (figure 29).

Pins D_{12} and D_{13} are multiplexed with peripheral function pins \overline{STOPC} and \overline{INT}_0 , respectively. The peripheral function modes of these pins are selected by bits 2 and 3 (PMRC2, PMRC3) of port mode register C (PMRC: \$025) (figure 30).

R Ports (R_0 – R_3): 52 input/output pins addressed in 4-bit units. Data is input to these ports by the LAR and LBR instructions, and output from them by the LRA and LRB instructions. Output data is stored in the port data register (PDR) for each pin. The on/off statuses of the output buffers of the R ports are controlled by R-port data control registers (DCR0–DCRC: \$030–\$03C) that are mapped to memory addresses (figure 29).

Pins R_0 – R_2 are multiplexed with peripheral pins \overline{INT}_1 – \overline{INT}_3 , respectively. The peripheral function modes of these pins are selected by bits 0–2 (PMRB0–PMRB2) of port mode register B (PMRB: \$024) (figure 31).

Pins R_3 – R_2 are multiplexed with peripheral pins TOB, TOC, and TOD, respectively. The peripheral function modes of these pins are selected by bits 0 and 1 (TMB20, TMB21) of timer mode register B2 (TMB2: \$013), bits 0–2 (TMC20–TMC22) of timer mode register C2 (TMC2: \$014), and bits 0–3 (TMD20–TMD23) of timer mode register D2 (TMD2: \$015) (figures 32, 33, and 34).

Pins R_3 and R_4 are multiplexed with peripheral pins \overline{EVNB} and \overline{EVND} , respectively. The peripheral function modes of these pins are selected by bits 0 and 1 (PMRC0, PMRC1) of port mode register C (PMRC: \$025) (figure 30).

Pins R_4 – R_3 are multiplexed with peripheral pins \overline{SCK}_1 , SI_1 , and SO_1 , respectively. The peripheral function modes of these pins are selected by bit 3 (SM1A3) of serial mode register 1A (SM1A: \$005), and bits 0 and 1 (PMRA0, PMRA1) of port mode register A (PMRA: \$004), as shown in figures 35 and 36.

HD404449 Series

Ports R5₁–R5₃ are multiplexed with peripheral function pins $\overline{\text{SCK}}_2$, SI₂, SO₂, respectively. The function modes of these pins can be selected by individual pins, by 2A setting bit 3 (SM2A3) of serial mode register 2A (SM2A: \$01B), and bits 2 and 3 (PMRA2, PMRA3) of port mode register A (PMRA: \$004) (figures 36 and 37).

Pull-Up MOS Transistor Control: A program-controlled pull-up MOS transistor is provided for each input/output pin other than input-only pins D₁₂ and D₁₃. The on/off status of all these transistors is controlled by bit 3 (MIS3) of the miscellaneous register (MIS: \$00C), and the on/off status of an individual transistor can also be controlled by the port data register (PDR) of the corresponding pin—enabling on/off control of that pin alone (table 23 and figure 38).

The on/off status of each transistor and the peripheral function mode of each pin can be set independently.

How to Deal with Unused I/O Pins: I/O pins that are not needed by the user system (floating) must be connected to V_{CC} to prevent LSI malfunctions due to noise. These pins must either be pulled up to V_{CC} by their pull-up MOS transistors or by resistors of about 100 k Ω .

Prescalers

The MCU has the following two prescalers, S and W.

The prescaler operating conditions are listed in table 25, and the prescaler output supply is shown in figure 39. The timer A–D input clocks except external events and the serial transmit clock except the external clock are selected from the prescaler outputs, depending on corresponding mode registers.

Prescaler Operation

Prescaler S: 11-bit counter that inputs a system clock signal. After being reset to \$000 by MCU reset, prescaler S divides the system clock. Prescaler S keeps counting, except in stop, watch, and subactive modes and at MCU reset.

Prescaler W: Five-bit counter that inputs the X1 input clock signal (32-kHz crystal oscillation) divided by eight. After being reset to \$00 by MCU reset, prescaler W divides the input clock. Prescaler W can be reset by software.

Table 25 Prescaler Operating Conditions

Prescaler	Input Clock	Reset Conditions	Stop Conditions
Prescaler S	System clock (in active and standby mode), Subsystem clock (in subactive mode)	MCU reset	MCU reset, stop mode, watch mode
Prescaler W	32-kHz crystal oscillation	Software	MCU reset, stop mode

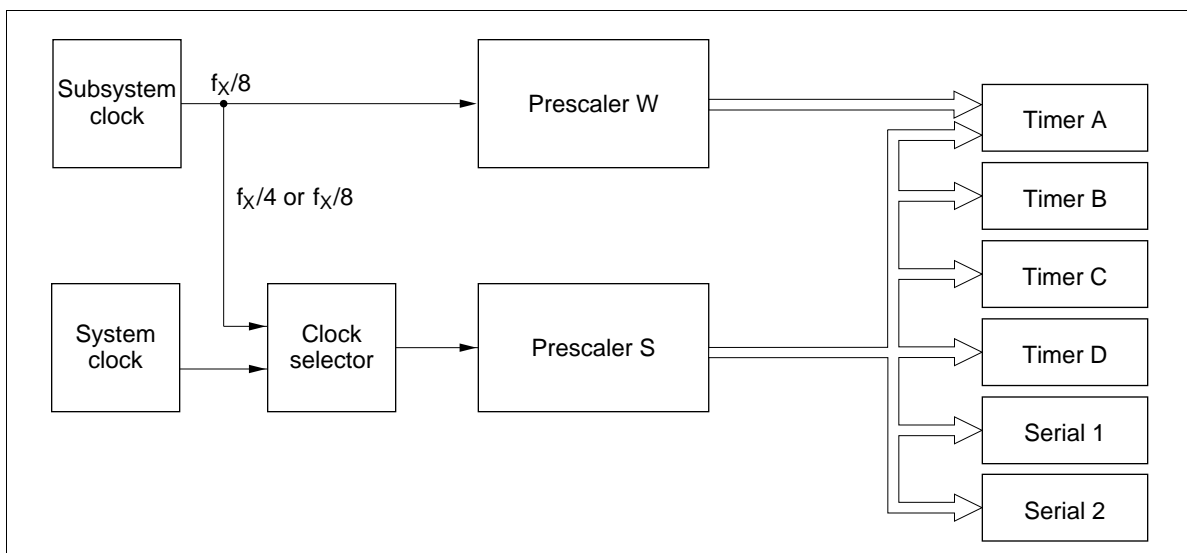

Figure 39 Prescaler Output Supply

HD404449 Series

Timers

The MCU has four timer/counters (A to D).

- Timer A: Free-running timer
- Timer B: Multifunction timer
- Timer C: Multifunction timer
- Timer D: Multifunction timer

Timer A is an 8-bit free-running timer. Timers B–D are 8-bit multifunction timers, whose functions are listed in table 26. The operating modes are selected by software.

Note: — means not available.

Timer A

Timer A Functions: Timer A has the following functions.

- Free-running timer
- Clock time-base

The block diagram of timer A is shown in figure 40.

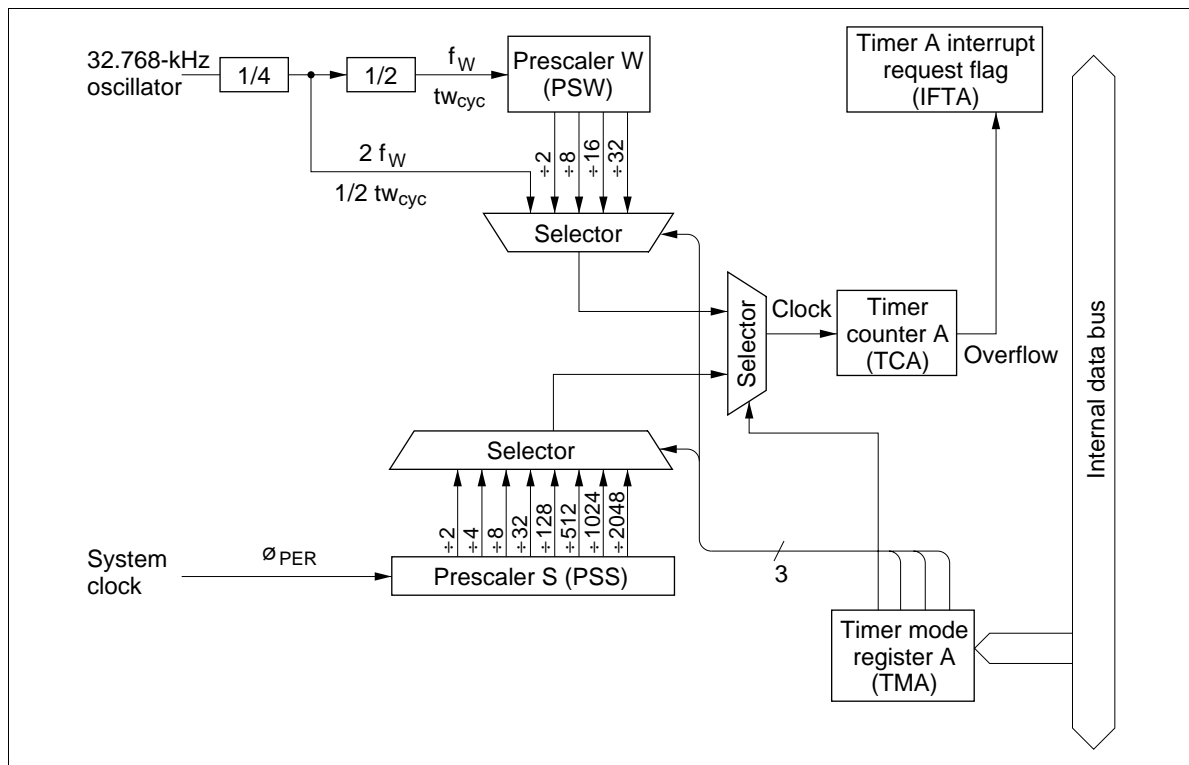

Figure 40 Timer A Block Diagram

Timer A Operations:

- Free-running timer operation: The input clock for timer A is selected by timer mode register A (TMA: \$008).

Timer A is reset to \$00 by MCU reset and incremented at each input clock. If an input clock is applied to timer A after it has reached \$FF, an overflow is generated, and timer A is reset to \$00. The overflow sets the timer A interrupt request flag (IFTA: \$001, bit 2). Timer A continues to be incremented after reset to \$00, and therefore it generates regular interrupts every 256 clocks.

- Clock time-base operation: Timer A is used as a clock time-base by setting bit 3 (TMA3) of timer mode register A (TMA: \$008) to 1. The prescaler W output is applied to timer A, and timer A generates interrupts at the correct timing based on the 32.768-kHz crystal oscillation. In this case, prescaler W and timer A can be reset to \$00 by software.

HD404449 Series

Registers for Timer A Operation: Timer A operating modes are set by the following registers.

- Timer mode register A (TMA: \$008): Four-bit write-only register that selects timer A's operating mode and input clock source as shown in figure 41.

Timer mode register A (TMA: \$008)

	1	0	0	PSW	$1/2t_{Wcyc}$	
			1	Inhibited		
		1	Don't care	PSW and TCA reset		

- Notes:
1. $t_{Wcyc} = 244.14 \mu s$ (when a 32.768-kHz crystal oscillator is used)
 2. Timer counter overflow output period (seconds) = input clock period (seconds) \times 256.
 3. The division ratio must not be modified during time-base mode operation, otherwise an overflow cycle error will occur.

Figure 41 Timer Mode Register A (TMA)

Timer B

Timer B Functions: Timer B has the following functions.

- Free-running/reload timer
- External event counter
- Timer output operation (toggle, 0, and 1 outputs)

The block diagram of timer B is shown in figure 42.

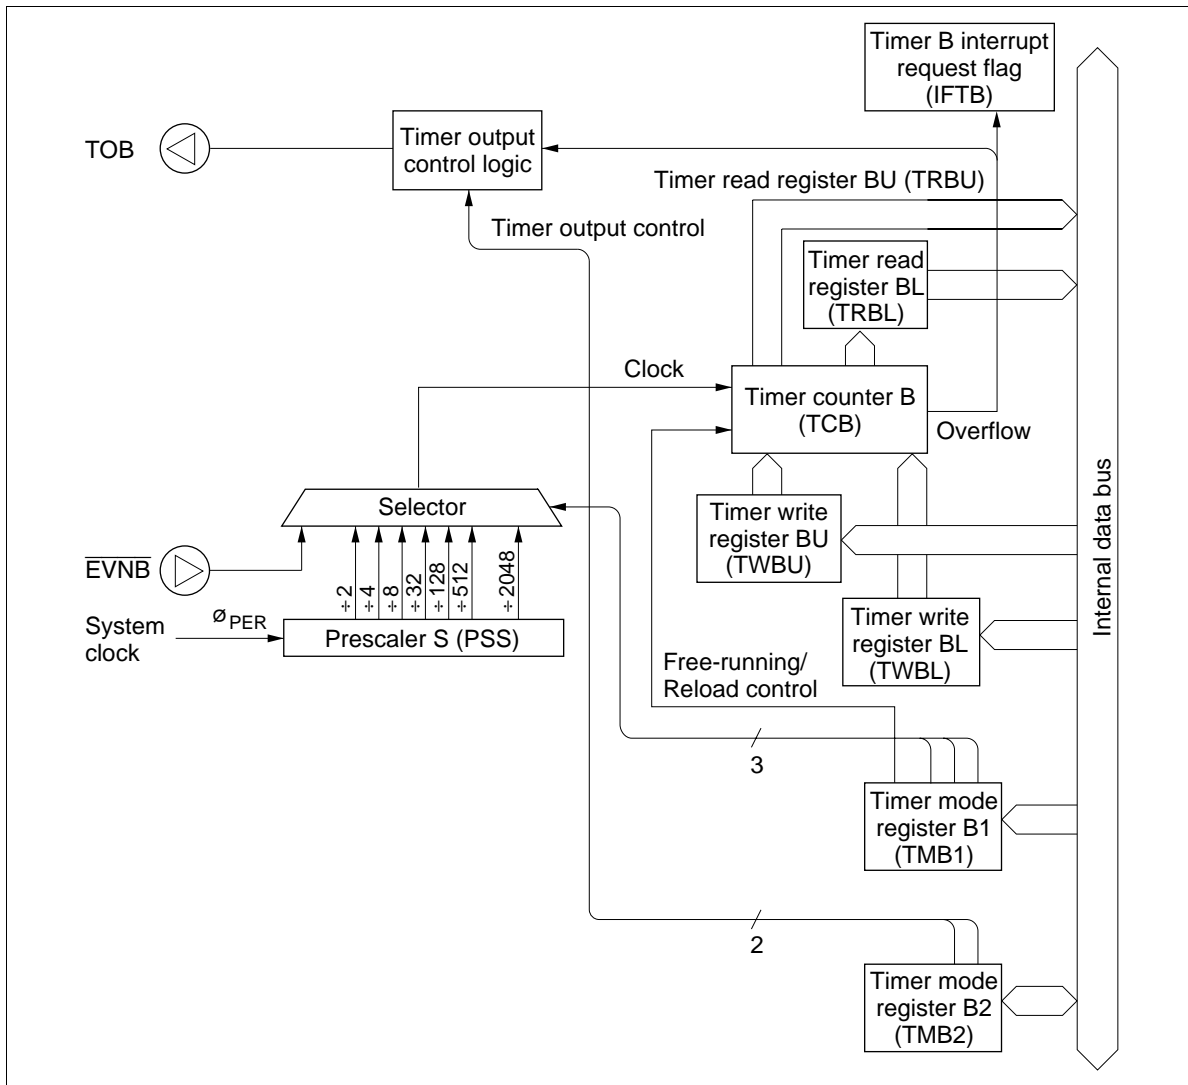

Figure 42 Timer B Block Diagram

HD404449 Series

Timer B Operations:

- Free-running/reload timer operation: The free-running/reload operation, input clock source, and prescaler division ratio are selected by timer mode register B1 (TMB1: \$009).

Timer B is initialized to the value set in timer write register B (TWBL: \$00A, TWBU: \$00B) by software and incremented by one at each clock input. If an input clock is applied to timer B after it has reached \$FF, an overflow is generated. In this case, if the reload timer function is enabled, timer B is initialized to its initial value set in timer write register B; if the free-running timer function is enabled, the timer is initialized to \$00 and then incremented again.

The overflow sets the timer B interrupt request flag (IFTB: \$002, bit 0). IFTB is reset by software or MCU reset. Refer to figure 3 and table 1 for details.

- External event counter operation: Timer B is used as an external event counter by selecting external event input as the input clock source. In this case, pin $R3_3/\overline{EVNB}$ must be set to \overline{EVNB} by port mode register C (PMRC: \$025).

Timer B is incremented by one at each falling edge of signals input to pin \overline{EVNB} . Other operations are basically the same as the free-running/ reload timer operation.

- Timer output operation: The following three output modes can be selected for timer B by setting timer mode register B2 (TMB2: \$013).

- Toggle
- 0 output
- 1 output

By selecting the timer output mode, pin $R3_0/TOB$ is set to TOB. The output from TOB is reset low by MCU reset.

- Toggle output: When toggle output mode is selected, the output level is inverted if a clock is input after timer B has reached \$FF. By using this function and reload timer function, clock signals can be output at a required frequency for the buzzer. The output waveform is shown in figure 43.
- 0 output: When 0 output mode is selected, the output level is pulled low if a clock is input after timer B has reached \$FF. Note that this function must be used only when the output level is high.
- 1 output: When 1 output mode is selected, the output level is set high if a clock is input after timer B has reached \$FF. Note that this function must be used only when the output level is low.

Figure 43 Timer Output Waveform

Registers for Timer B Operation: By using the following registers, timer B operation modes are selected and the timer B count is read and written.

- Timer mode register B1 (TMB1: \$009)
 - Timer mode register B2 (TMB2: \$013)
 - Timer write register B (TWBL: \$00A, TWBU: \$00B)
 - Timer read register B (TRBL: \$00A, TRBU: \$00B)
 - Port mode register C (PMRC: \$025)
- Timer mode register B1 (TMB1: \$009): Four-bit write-only register that selects the free-running/reload timer function, input clock source, and the prescaler division ratio as shown in figure 44. It is reset to \$0 by MCU reset.

HD40449 Series

Writing to this register is valid from the second instruction execution cycle after the execution of the previous timer mode register B1 write instruction. Setting timer B's initialization by writing to timer write register B (TWBL: \$00A, TWBU: \$00B) must be done after a mode change becomes valid.

Figure 44 Timer Mode Register B1 (TMB1)

- Timer mode register B2 (TMB2: \$013): Two-bit read/write register that selects the timer B output mode as shown in figure 45. It is reset to \$0 by MCU reset.

Figure 45 Timer Mode Register B2 (TMB2)

- Timer write register B (TWBL: \$00A, TWBU: \$00B): Write-only register consisting of the lower digit (TWBL) and the upper digit (TWBU) as shown in figures 46 and 47. The lower digit is reset to \$0 by MCU reset, but the upper digit value is invalid.

Timer B is initialized by writing to timer write register B (TWBL: \$00A, TWBU: \$00B). In this case, the lower digit (TWBL) must be written to first, but writing only to the lower digit does not change the timer B value. Timer B is initialized to the value in timer write register B at the same time the upper digit (TWBU) is written to. When timer write register B is written to again and if the lower digit value needs no change, writing only to the upper digit initializes timer B.

Figure 46 Timer Write Register B Lower Digit (TWBL)

Figure 47 Timer Write Register B Upper Digit (TWBU)

HD404449 Series

- Timer read register B (TRBL: \$00A, TRBU: \$00B): Read-only register consisting of the lower digit (TRBL) and the upper digit (TRBU) that holds the count of the timer B upper digit (figures 48 and 49). The upper digit (TRBU) must be read first. At this time, the count of the timer B upper digit is obtained, and the count of the timer B lower digit is latched to the lower digit (TRBL). After this, by reading TRBL, the count of timer B when TRBU is read can be obtained.

Figure 49 Timer Read Register B Upper Digit (TRBU)

- Port mode register C (PMRC: \$025): Write-only register that selects R3₃/ $\overline{\text{EVNB}}$ pin function as shown in figure 50. It is reset to \$0 by MCU reset.

Figure 50 Port Mode Register C (PMRC)

Timer C

Timer C Functions: Timer C has the following functions.

- Free-running/reload timer
- Watchdog timer
- Timer output operation (toggle, 0, 1, and PWM outputs)

The block diagram of timer C is shown in figure 51.

Figure 51 Timer C Block Diagram

Timer C Operations:

- Free-running/reload timer operation: The free-running/reload operation, input clock source, and prescaler division ratio are selected by timer mode register C1 (TMC1: \$00D).

Timer C is initialized to the value set in timer write register C (TWCL: \$00E, TWCU: \$00F) by software and incremented by one at each clock input. If an input clock is applied to timer C after it has reached \$FF, an overflow is generated. In this case, if the reload timer function is enabled, timer C is initialized to its initial value set in timer write register C; if the free-running timer function is enabled, the timer is initialized to \$00 and then incremented again.

The overflow sets the timer C interrupt request flag (IFTC: \$002, bit 2). IFTC is reset by software or MCU reset. Refer to figure 3 and table 1 for details.

- Watchdog timer operation: Timer C is used as a watchdog timer for detecting out-of-control program routines by setting the watchdog on flag (WDON: \$020, bit 1) to 1. If a program routine runs out of control and an overflow is generated, the MCU is reset. Program run can be controlled by initializing timer C by software before it reaches \$FF.
- Timer output operation: The following four output modes can be selected for timer C by setting timer mode register C2 (TMC2: \$014).
 - Toggle
 - 0 output
 - 1 output
 - PWM output

By selecting the timer output mode, pin R3_I/TOC is set to TOC. The output from TOC is reset low by MCU reset.

- Toggle output: The operation is basically the same as that of timer-B's toggle output.
- 0 output: The operation is basically the same as that of timer-B's 0 output.
- 1 output: The operation is basically the same as that of timer-B's 1 output.
- PWM output: When PWM output mode is selected, timer C provides the variable-duty pulse output function. The output waveform differs depending on the contents of timer mode register C1 (TMC1: \$00D) and timer write register C (TWCL: \$00E, TWCU: \$00F). The output waveform is shown in figure 43.

Registers for Timer C Operation: By using the following registers, timer C operation modes are selected and the timer C count is read and written.

- Timer mode register C1 (TMC1: \$00D)
- Timer mode register C2 (TMC2: \$014)
- Timer write register C (TWCL: \$00E, TWCU: \$00F)
- Timer read register C (TRCL: \$00E, TRCU: \$00F)
- Timer mode register C1 (TMC1: \$00D): Four-bit write-only register that selects the free-running/reload timer function, input clock source, and prescaler division ratio as shown in figure 52. It is reset to \$0 by MCU reset.

Writing to this register is valid from the second instruction execution cycle after the execution of the previous timer mode register C1 write instruction. Setting timer C's initialization by writing to timer write register C (TWCL: \$00E, TWCU: \$00F) must be done after a mode change becomes valid.
- Timer mode register C2 (TMC2: \$014): Three-bit read/write register that selects the timer C output mode as shown in figure 53. It is reset to \$0 by MCU reset.

HD404449 Series

- Timer write register C (TWCL: \$00E, TWCU: \$00F): Write-only register consisting of a lower digit (TWCL) and an upper digit (TWCU) as shown in figures 54 and 55. The operation of timer write register C is basically the same as that of timer write register B (TWBL: \$00A, TWBU: \$00B).
- Timer read register C (TRCL: \$00E, TRCU: \$00F): Read-only register consisting of a lower digit (TRCL) and an upper digit (TRCU) that holds the count of the timer C upper digit as shown in figures 56 and 57. The operation of timer read register C is basically the same as that of timer read register B (TRBL: \$00A, TRBU: \$00B).

Timer D

Timer D Functions: Timer D has the following functions.

- Free-running/reload timer
- External event counter
- Timer output operation (toggle, 0, 1, and PWM outputs)
- Input capture timer

The block diagram for each operation mode of timer D is shown in figures 58 (A) and (B).

Figure 58 (A) Timer D Block Diagram (Free-Running/Reload Timer)

Figure 58 (B) Timer D Block Diagram (Input Capture Timer)

Timer D Operations:

- Free-running/reload timer operation: The free-running/reload operation, input clock source, and prescaler division ratio are selected by timer mode register D1 (TMD1: \$010).
 Timer D is initialized to the value set in timer write register D (TWDL: \$011, TWDU: \$012) by software and incremented by one at each clock input. If an input clock is applied to timer D after it has reached \$FF, an overflow is generated. In this case, if the reload timer function is enabled, timer D is initialized to its initial value set in timer write register D; if the free-running timer function is enabled, the timer is initialized to \$00 and then incremented again.
 The overflow sets the timer D interrupt request flag (IFTD: \$003, bit 0). IFTD is reset by software or MCU reset. Refer to figure 3 and table 1 for details.
- External event counter operation: Timer D is used as an external event counter by selecting the external event input as an input clock source. In this case, pin R4₀/EVND must be set to EVND by port mode register C (PMRC: \$025).
 Either falling or rising edge, or both falling and rising edges of input signals can be selected as the external event detection edge by detection edge select register 2 (ESR2: \$027). When both rising and falling edges detection is selected, the time between the falling edge and rising edge of input signals must be $2t_{cyc}$ or longer.
 Timer D is incremented by one at each detection edge selected by detection edge select register 2 (ESR2: \$027). The other operation is basically the same as the free-running/reload timer operation.
- Timer output operation: The following four output modes can be selected for timer D by setting timer mode register D2 (TMD2: \$015).
 - Toggle
 - 0 output
 - 1 output
 - PWM output

By selecting the timer output mode, pin R3₂/TOD is set to TOD. The output from TOD is reset low by MCU reset.

 - Toggle output: The operation is basically the same as that of timer-B's toggle output.
 - 0 output: The operation is basically the same as that of timer-B's 0 output.
 - 1 output: The operation is basically the same as that of timer-B's 1 output.
 - PWM output: The operation is basically the same as that of timer-C's PWM output.
- Input capture timer operation: The input capture timer counts the clock cycles between trigger edges input to pin EVND.
 Either falling or rising edge, or both falling and rising edges of input signals can be selected as the trigger input edge by detection edge select register 2 (ESR2: \$027).

HD404449 Series

When a trigger edge is input to EVND, the count of timer D is written to timer read register D (TRDL: \$011, TRDU: \$012), and the timer D interrupt request flag (IFTD: \$003, bit 0) and the input capture status flag (ICSF: \$021, bit 0) are set. Timer D is reset to \$00, and then incremented again. While ICSF is set, if a trigger input edge is applied to timer D, or if timer D generates an overflow, the input capture error flag (ICEF: \$021, bit 1) is set. ICSF and ICEF are reset to 0 by MCU reset or by writing 0.

By selecting the input capture operation, pin R3₂/TOD is set to R3₂ and timer D is reset to \$00.

Registers for Timer D Operation: By using the following registers, timer D operation modes are selected and the timer D count is read and written.

- Timer mode register D1 (TMD1: \$010)
 - Timer mode register D2 (TMD2: \$015)
 - Timer write register D (TWDL: \$011, TWDU: \$012)
 - Timer read register D (TRDL: \$011, TRDU: \$012)
 - Port mode register C (PMRC: \$025)
 - Detection edge select register 2 (ESR2: \$027)
- Timer mode register D1 (TMD1: \$010): Four-bit write-only register that selects the free-running/reload timer function, input clock source, and the prescaler division ratio as shown in figure 59. It is reset to \$0 by MCU reset.

Writing to this register is valid from the second instruction execution cycle after the execution of the previous timer mode register D1 (TMD1: \$010) write instruction. Setting timer D's initialization by writing to timer write register D (TWDL: \$011, TWDU: \$012) must be done after a mode change becomes valid.

When selecting the input capture timer operation, select the internal clock as the input clock source.
 - Timer mode register D2 (TMD2: \$015): Four-bit read/write register that selects the timer D output mode and input capture operation as shown in figure 60. It is reset to \$0 by MCU reset.

Figure 59 Timer Mode Register D1 (TMD1)

- Timer write register D (TWDL: \$011, TWDU: \$012): Write-only register consisting of a lower digit (TWDL) and an upper digit (TWDU) as shown in figures 61 and 62. The operation of timer write register D is basically the same as that of timer write register B (TWBL: \$00A, TWBU: \$00B).
- Timer read register D (TRDL: \$011, TRDU: \$012): Read-only register consisting of a lower digit (TRDL) and an upper digit (TRDU) as shown in figures 63 and 64. The operation of timer read register D is basically the same as that of timer read register B (TRBL: \$00A, TRBU: \$00B).
When the input capture timer operation is selected and if the count of timer D is read after a trigger is input, either the lower or upper digit can be read first.
- Port mode register C (PMRC: \$025): Write-only register that selects R4₀/EVND pin function as shown in figure 50. It is reset to \$0 by MCU reset.
- Detection edge select register 2 (ESR2: \$027): Write-only register that selects the detection edge of signals input to pin EVND as shown in figure 65. It is reset to \$0 by MCU reset.

Notes on Use

When using the timer output as PWM output, note the following point. From the update of the timer write register until the occurrence of the overflow interrupt, the PWM output differs from the period and duty settings, as shown in table 27. The PWM output should therefore not be used until after the overflow interrupt following the update of the timer write register. After the overflow, the PWM output will have the set period and duty cycle.

HD404449 Series

Table 27 PWM Output Following Update of Timer Write Register

Serial Interface

The MCU has two channels of serial interface. The transfer and receive start instructions differ according to the serial interface channel, but other functions are the same. The serial interface serially transfers or receives 8-bit data, and includes the following features.

- Multiple transmit clock sources
 - External clock
 - Internal prescaler output clock
 - System clock
- Output level control in idle states

Five registers, an octal counter, and a multiplexer are also configured for serial interfaces 1 and 2 as follows.

Serial interface 1

- Serial data register 1 (SR1L: \$006, SR1U: \$007)
- Serial mode register 1A (SM1A: \$005)
- Serial mode register 1B (SM1B: \$028)
- Port mode register A (PMRA: \$004)
- Miscellaneous register (MIS: \$00C)
- Octal counter (OC)
- Selector

Serial interface 2

- Serial data register 2 (SR2L: \$01D, SR2U: \$01E)
- Serial mode register 2A (SM2A: \$01B)
- Serial mode register 2B (SM2B: \$01C)
- Port mode register A (PMRA: \$004)
- Octal counter (OC)
- Selector

The block diagram of serial interfaces 1 and 2 are shown in figure 66.

Figure 66 Serial Interfaces 1 and 2 Block Diagram

Serial Interface Operation

Selecting and Changing the Operating Mode: Tables 28 (A) and 28 (B) list the serial interfaces' operating modes. To select an operating mode, use one of these combinations of port mode register A (PMRA: \$004), serial mode register 1A (SM1A: \$005), and serial mode register 2A (SM2A: \$01B) settings; to change the operating mode of serial interface 1, always initialize the serial interface internally by writing data to serial mode register 1A; and to change the operating mode of serial interface 2, always initialize the serial interface internally by writing data to serial mode register 2A. Note that serial interface

1 is initialized by writing data to serial mode register 1A, and serial interface 2 is initialized by writing data to serial mode register 2A. Refer to the following section Registers for Serial Interface for details.

Pin Setting: The $R4_1/\overline{SCK}_1$ pin is controlled by writing data to serial mode register 1A (SM1A: \$005). The $R5_1/\overline{SCK}_2$ pin is controlled by writing data to serial mode register 2A (SM2A: \$01B). Pins $R4_2/SI_1$, $R4_3/SO_1$, $R5_2/SI_2$, and $R5_3/SO_2$ are controlled by writing data to port mode register A (PMRA: \$004). Refer to the following section Registers for Serial Interface for details.

Transmit Clock Source Setting: The transmit clock source of serial interface 1 is set by writing data to serial mode register 1A (SM1A: \$005) and serial mode register 1B (SM1B: \$028). The transmit clock source of serial interface 2 is set by writing data to serial mode register 2A (SM2A: \$01B) and serial mode register 2B (SM2B: \$01C). Refer to the following section Registers for Serial Interface for details.

Data Setting: Transmit data of serial interface 1 is set by writing data to serial data register 1 (SR1L: \$006, SR1U: \$007). Transmit data of serial interface 2 is set by writing data to serial data register 2 (SR2L: \$01D, SR2U: \$01E). Receive data of serial interface 1 is obtained by reading the contents of serial data register 1. Receive data of serial interface 2 is obtained by reading the contents of serial data register 2. The serial data is shifted by each serial interface transmit clock and is input from or output to an external system.

The output level of the SO_1 and SO_2 pins is invalid until the first data of each serial interface is output after MCU reset, or until the output level control in idle states is performed.

Transfer Control: Serial interface 1 is activated by the STS instruction. Serial interface 2 is activated by a dummy read of serial mode register 2A (SM2A: \$01B), which will be referred to as SM2A read. The octal counter is reset to 000 by the STS instruction (serial interface 2 is SM2A read), and it increments at the rising edge of the transmit clock for each serial interface. When the eighth transmit clock signal is input or when serial transmission/reception is discontinued, the octal counter is reset to 000, the serial 1 interrupt request flag (IFS1: \$003, bit 2) for serial interface 1 and serial 2 interrupt request flag (IFS2: \$023, bit 2) for serial interface 2 are set, and the transfer stops.

When the prescaler output is selected as the transmit clock of serial interface 1, the transmit clock frequency is selected as $4t_{cyc}$ to $8192t_{cyc}$ by setting bits 0 to 2 (SM1A0–SM1A2) of serial mode register 1A (SM1A: \$005) and bit 0 (SM1B0) of serial mode register 1B (SM1B: \$028) as listed in table 29. When the prescaler output is selected as the transmit clock of serial interface 2, the transmit clock frequency is selected as $4t_{cyc}$ to $8192t_{cyc}$ by setting bits 0 to 2 (SM2A0–SM2A2) of serial mode register 2A (SM2A: \$01B) and bit 0 (SM2B0) of serial mode register 2B (SM2B: \$01C).

Note: To start serial interface 2, simply read serial mode register 2A by using the instruction that compares serial mode register 2A (SM2A: \$01B) with the accumulator.
Serial mode register 2A (SM2A: \$01B) is a read-only register, so \$0 can be read.

	1	0	0	$\div 16$	$32t_{cyc}$
			1	$\div 4$	$8t_{cyc}$

Operating States: The serial interface has the following operating states; transitions between them are shown in figure 67.

- STS wait state (serial interface 2 is in SM2A read wait state)
- Transmit clock wait state
- Transfer state
- Continuous clock output state (only in internal clock mode)

The operation state of serial interface 2 is the same as serial interface 1 except that the STS instruction of serial interface 1 changes to SM2A read. The following shows the operation state of serial interface 1.

- STS wait state: The serial interface enters STS wait state by MCU reset (00, 10 in figure 67). In STS wait state, serial interface 1 is initialized and the transmit clock is ignored. If the STS instruction is then executed (01, 11), serial interface 1 enters transmit clock wait state.

Figure 67 Serial Interface State Transitions

- Transmit clock wait state: Transmit clock wait state is the period between the STS execution and the falling edge of the first transmit clock. In transmit clock wait state, input of the transmit clock (02, 12) increments the octal counter, shifts serial data register 1 (SR1L: \$006, SR1U: \$007), and enters the

HD404449 Series

serial interface in transfer state. However, note that if continuous clock output mode is selected in internal clock mode, the serial interface does not enter transfer state but enters continuous clock output state (17).

The serial interface enters STS wait state by writing data to serial mode register 1A (SM1A: \$005) (04, 14) in transmit clock wait state.

- **Transfer state:** Transfer state is the period between the falling edge of the first clock and the rising edge of the eighth clock. In transfer state, the input of eight clocks or the execution of the STS instruction sets the octal counter to 000, and the serial interface enters another state. When the STS instruction is executed (05, 15), transmit clock wait state is entered. When eight clocks are input, transmit clock wait state is entered (03) in external clock mode, and STS wait state is entered (13) in internal clock mode. In internal clock mode, the transmit clock stops after outputting eight clocks.

In transfer state, writing data to serial mode register 1A (SM1A: \$005) (06, 16) initializes serial interface 1, and STS wait state is entered.

If the state changes from transfer to another state, the serial 1 interrupt request flag (IFS1: \$003, bit 2) is set by the octal counter that is reset to 000.

- **Continuous clock output state (only in internal clock mode):** Continuous clock output state is entered only in internal clock mode. In this state, the serial interface does not transmit/receive data but only outputs the transmit clock from the \overline{SCK}_1 pin.

When bits 0 and 1 (PMRA0, PMRA1) of port mode register A (PMRA: \$004) are 00 in transmit clock wait state and if the transmit clock is input (17), the serial interface enters continuous clock output state.

If serial mode register 1A (SM1A: \$005) is written to in continuous clock output mode (18), STS wait state is entered.

Output Level Control in Idle States: When serial interface 1 is in STS instruction wait state and when serial interface 2 is in SM2A read wait state and transmit clock state, the output of each serial output pin, SO_1 and SO_2 , can be controlled by setting bit 1 (SM1B1) of serial mode register 1B (SM1B: \$028) to 0 or 1, or bit 1 (SM2B1) of serial mode register 2B (SM2B: \$01C) to 0 or 1. The output level control example of serial interface 1 is shown in figure 68. Note that the output level cannot be controlled in transfer state.

Figure 68 Example of Serial Interface 1 Operation Sequence

HD404449 Series

Transmit Clock Error Detection (In External Clock Mode): Each serial interface will malfunction if a spurious pulse caused by external noise conflicts with a normal transmit clock during transfer. A transmit clock error of this type can be detected as shown in figure 69.

If more than eight transmit clocks are input in transfer state, at the eighth clock including a spurious pulse by noise, the octal counter reaches 000, the serial 1 interrupt request flag (IFS1: \$003, bit 2) is set, and transmit clock wait state is entered. At the falling edge of the next normal clock signal, the transfer state is entered. After the transfer is completed and IFS1 is reset, writing to serial mode register 1A (SM1A: \$005) changes the state from transfer to STS wait. At this time serial interface 1 is in the transfer state, and the serial 1 interrupt request flag (IFS1: \$003, bit 2) is set again, and therefore the error can be detected. The same applies to serial interface 2.

Notes on Use:

- Initialization after writing to registers: If port mode register A (PMRA: \$004) is written to in transmit clock wait state or in transfer state, the serial interface must be initialized by writing to serial mode register 1A (SM1A: \$005) and serial mode register 2A (SM2A: \$01B) again.
- Serial 1 interrupt request flag (IFS1: \$003, bit 2) and serial 2 interrupt request flag (IFS2: \$023, bit 2) set: For serial interface 1, if the state is changed from transfer state to another by writing to serial mode register 1A (SM1A: \$005) or executing the STS instruction during the first low pulse of the transmit clock, the serial 1 interrupt request flag (IFS1: \$003, bit 2) is not set. In the same way for serial interface 2, if the state is changed from transfer state to another by writing to serial mode register 2A (SM2A: \$01B) or by executing the STS instruction during the first low pulse of the transmit clock, the serial 2 interrupt request flag (IFS2: \$023, bit 2) is not set. To set the serial 1 interrupt request flag (IFS1: \$003, bit 2), a serial mode register 1A (SM1A: \$005) write or STS instruction execution must be programmed to be executed after confirming that the \overline{SCK}_1 pin is at 1, that is, after executing the input instruction to port R4. To set the serial 2 interrupt request flag (IFS2: \$023, bit 2), a serial mode register 2A (SM2A: \$01B) write or SM2A instruction execution must be programmed to be executed after confirming that the \overline{SCK}_2 pin is at 1, that is, after executing the input instruction to port R5.

Transmit clock error detection procedures

Figure 69 Transmit Clock Error Detection

HD404449 Series

Registers for Serial Interface

The serial interface operation is selected, and serial data is read and written by the following registers.

For serial interface 1

- Serial mode register 1A (SM1A: \$005)
- Serial mode register 1B (SM1B: \$028)
- Serial data register 1
(SR1L: \$006, SR1U: \$007)
- Port mode register A (PMRA: \$004)
- Miscellaneous register (MIS: \$00C)

For serial interface 2

- Serial mode register 2A (SM2A: \$01B)
- Serial mode register 2B (SM2B: \$01C)
- Serial data register 2
(SR2L: \$01D, SR2U: \$01E)
- Port mode register A (PMRA: \$004)

Serial Mode Register 1A (SM1A: \$005): This register has the following functions (figure 70).

- $R4_I/\overline{SCK}_1$ pin function selection
- Serial interface 1 transmit clock selection
- Serial interface 1 prescaler division ratio selection
- Serial interface 1 initialization

Serial mode register 1A (SM1A: \$005) is a 4-bit write-only register. It is reset to \$0 by MCU reset.

A write signal input to serial mode register 1A (SM1A: \$005) discontinues the input of the transmit clock to serial data register 1 (SR1L: \$006, SR1U: \$007) and the octal counter, and the octal counter is reset to 000. Therefore, if a write is performed during data transfer, the serial 1 interrupt request flag (IFS1: \$003, bit 2) is set.

Written data is valid from the second instruction execution cycle after the write operation, so the STS instruction must be executed at least two cycles after that.

Figure 70 Serial Mode Register 1A (SM1A)

Serial Mode Register 1B (SM1B: \$028): This register has the following functions (figure 71).

- Serial interface 1 prescaler division ratio selection
- Serial interface 1 output level control in idle states

Serial mode register 1B (SM1B: \$028) is a 2-bit write-only register. It cannot be written during data transfer.

By setting bit 0 (SM1B0) of this register, the serial interface 1 prescaler division ratio is selected. Only bit 0 (SM1B0) can be reset to 0 by MCU reset. By setting bit 1 (SM1B1), the output level of the SO₁ pin is controlled in idle states of serial interface 1. The output level changes at the same time that SM1B1 is written to.

0	Prescaler output divided by 2
1	Prescaler output divided by 4

Figure 71 Serial Mode Register 1B (SM1B)

Serial Data Register 1 (SR1L: \$006, SR1U: \$007): This register has the following functions (figures 72 and 73)

- Serial interface 1 transmission data write and shift
- Serial interface 1 receive data shift and read

Writing data in this register is output from the SO₁ pin, LSB first, synchronously with the falling edge of the transmit clock; data is input, LSB first, through the SI₁ pin at the rising edge of the transmit clock. Input/output timing is shown in figure 74.

Data cannot be read or written during serial data transfer. If a read/write occurs during transfer, the accuracy of the resultant data cannot be guaranteed.

Serial data register 1 (lower digit) (SR1L: \$006)

Bit name	SR17	SR16	SR15	SR14

Figure 73 Serial Data Register 1 (SR1U)

Figure 74 Serial Interface Output Timing

HD404449 Series

Port Mode Register A (PMRA: \$004): This register has the following functions (figure 75).

- R4₂/SI₁ pin function selection
- R4₃/SO₁ pin function selection
- R5₂/SI₂ pin function selection
- R5₃/SO₂ pin function selection

Port mode register A (PMRA: \$004) is a 4-bit write-only register, and is reset to \$0 by MCU reset.

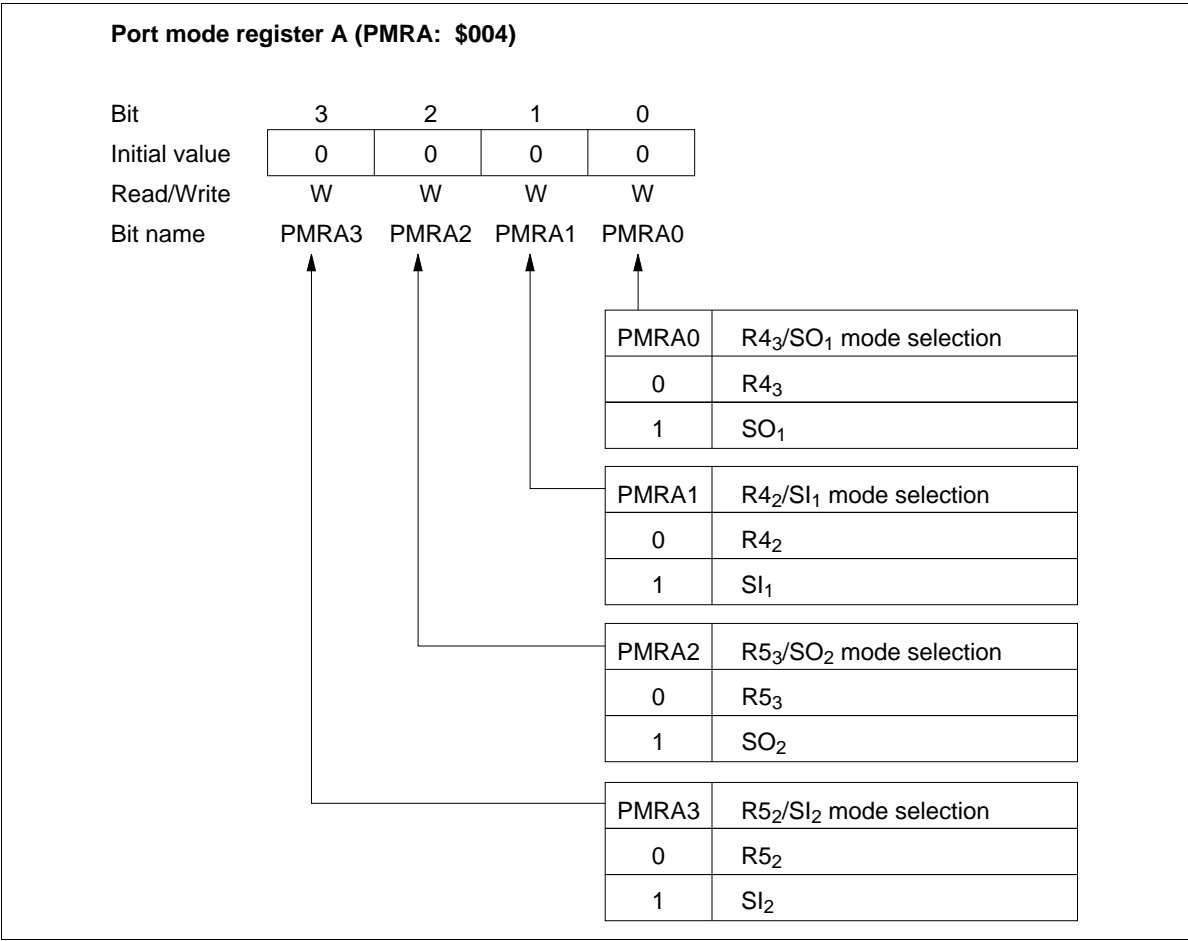

Figure 75 Port Mode Register A (PMRA)

Miscellaneous Register (MIS: \$00C): This register has the following functions (figure 76).

- R₄₃/SO₁ pin PMOS control

Miscellaneous register (MIS: \$00C) is a 4-bit write-only register and is reset to \$0 by MCU reset.

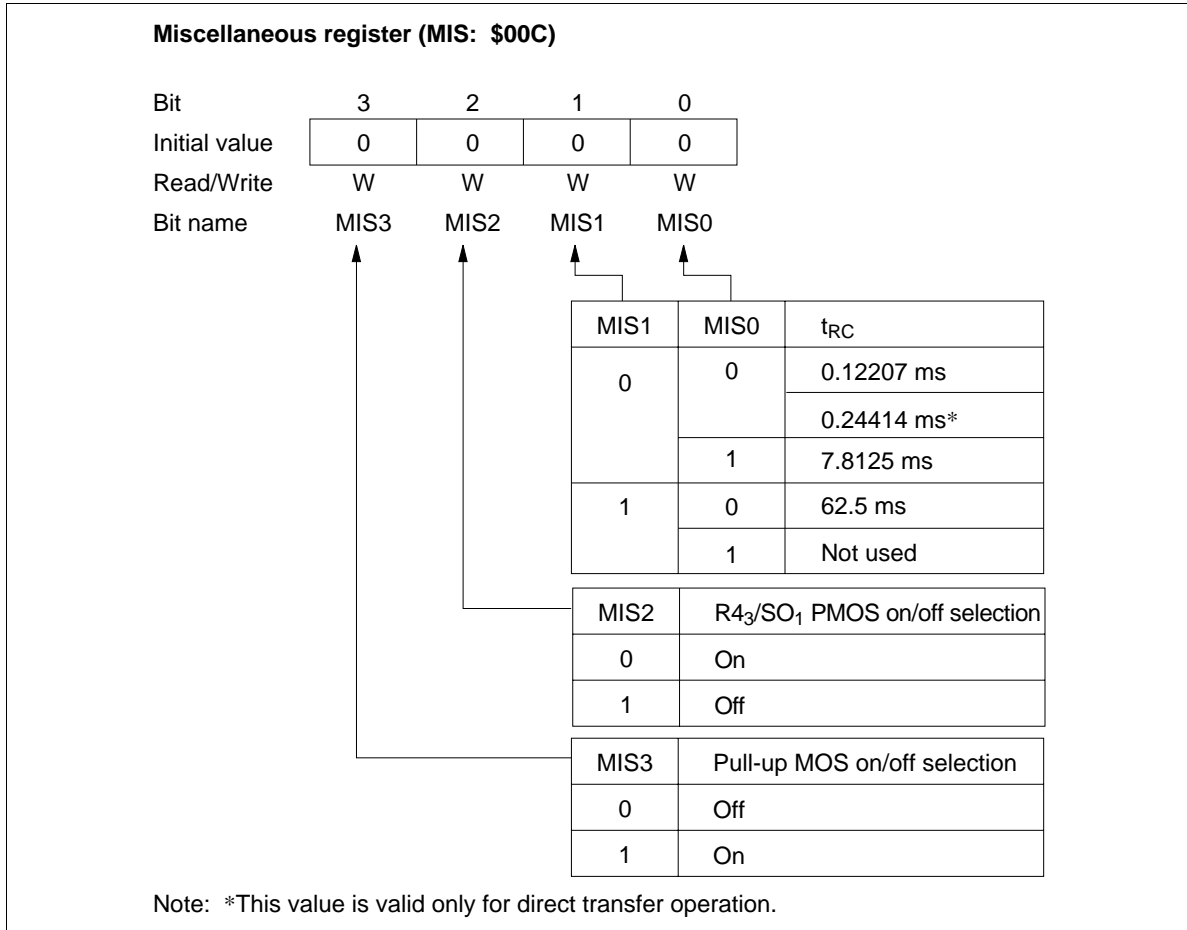

Figure 76 Miscellaneous Register (MIS)

Serial Mode Register 2A (SM2A: \$01B): This register has the following functions (figure 77).

- R₅₁/SCK₂ pin function selection
- Serial interface 2 transmit clock selection
- Serial interface 2 prescaler division ratio selection
- Serial interface 2 initialization

Serial mode register 2A (SM2A: \$01B) is a 4-bit write-only register. It is reset to \$0 by MCU reset.

A write signal input to serial mode register 2A (SM2A: \$01B) discontinues the input of the transmit clock to serial data register 2 (SR2L: \$01D, SR1U: \$01E) and the octal counter, and the octal counter is reset to

HD404449 Series

000. Therefore, if a write is performed during data transfer, the serial 2 interrupt request flag (IFS2: \$023, bit 2) is set.

Written data is valid from the second instruction execution cycle after the write operation, so the SM2A read instruction must be executed at least two cycles after that.

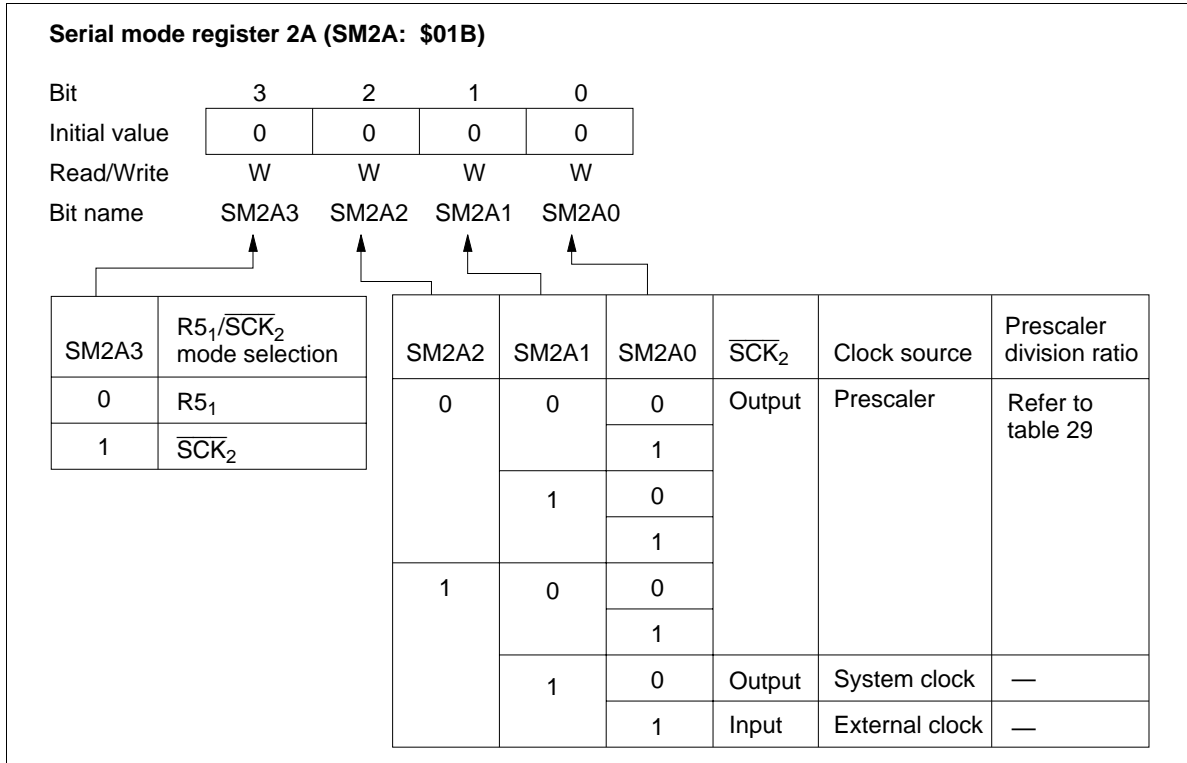

Figure 77 Serial Mode Register 2A (SM2A)

Serial Mode Register 2B (SM2B: \$01C): This register has the following functions (figure 78).

- Serial interface 2 prescaler division ratio selection
- Serial interface 2 output level control in idle states
- R5₃/SO₂ pin PMOS control

Serial mode register 2B (SM2B: \$01C) is a 3-bit write-only register. It cannot be written during serial interface 2 data transfer. Bit 0 (SM2B0) and bit 2 (SM2B2) is reset to \$0 by MCU reset.

By setting bit 0 (SM2B0) of this register, the serial interface 2 prescaler division ratio of serial interface 2 is selected. By resetting bit 1 (SM2B1), the output level of the SO₂ pin is controlled in idle states of serial interface 2. The output level changes at the same time that SM2B1 is written to.

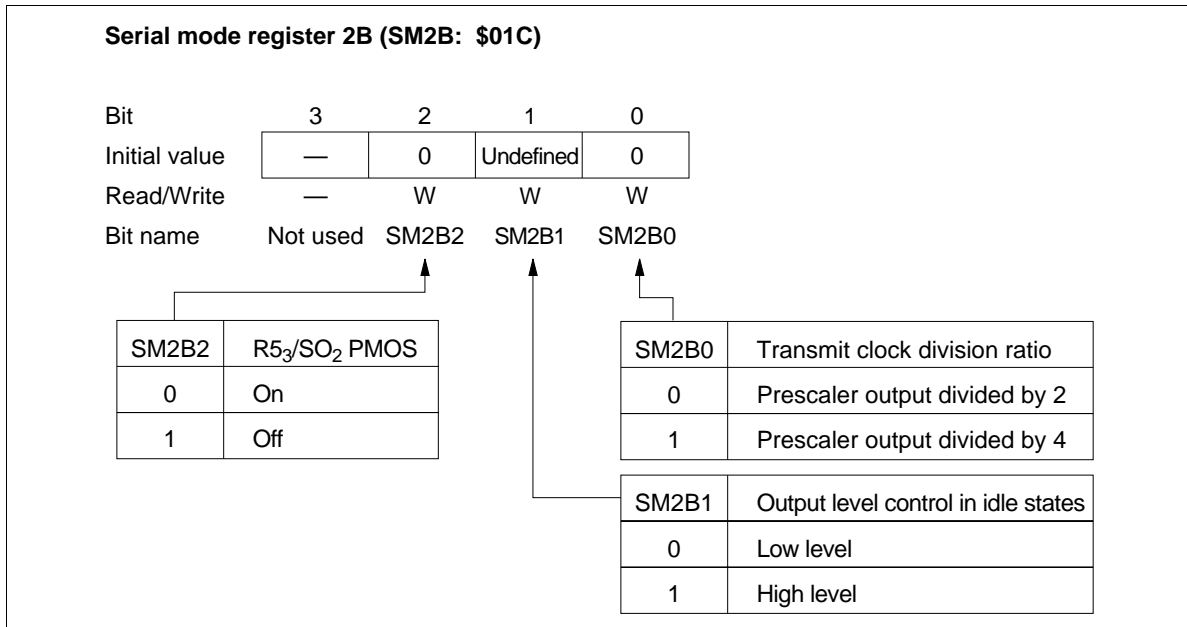

Figure 78 Serial Mode Register 2B (SM2B)

Serial Data Register 2 (SR2L: \$01D, SR2U: \$01E): This register has the following functions (figures 79 and 80).

- Serial interface 2 transmission data write and shift
- Serial interface 2 receive data shift and read

Writing data in this register is output from the SO₂ pin, LSB first, synchronously with the falling edge of the transmit clock; data is input, LSB first, through the SI₂ pin at the rising edge of the transmit clock.

Data cannot be read or written during serial data transfer. If a read/write occurs during transfer, the accuracy of the resultant data cannot be guaranteed.

Figure 80 Serial Data Register 2 (SR2U)

A/D Converter

The MCU has a built-in A/D converter that uses a sequential comparison method with a resistor ladder. It can measure four analog inputs with 8-bit resolution. As shown in the block diagram of figure 81, the A/D converter has a 4-bit A/D mode register, a 1-bit A/D start flag, and a 4-bit plus 4-bit A/D data register.

Figure 81 A/D Converter Block Diagram

A/D Mode Register (AMR: \$016): Four-bit write-only register which selects the A/D conversion period and indicates analog input pin information. Bit 0 of the A/D mode register selects the A/D conversion period, and bits 2 and 3 select a channel, as shown in figure 82.

A/D Start Flag (ADSF: \$020, Bit 2): One-bit flag that initiates A/D conversion when set to 1. At the completion of A/D conversion, the converted data is stored in the A/D data register and the A/D start flag is cleared. Refer to figure 86.

A/D Data Register (ADRL: \$017, ADRU: \$018): Eight-bit read-only register consisting of a 4-bit lower digit and 4-bit upper digit. This register is not cleared by reset. After the completion of A/D conversion, the resultant eight-bit data is held in this register until the start of the next conversion (figures 83, 84, and 85).

HD404449 Series

Note on Use: Use the SEM and SEMD instructions to write data to the A/D start flag (ADSF: \$020, bit 2), but make sure that the A/D start flag is not written to during A/D conversion. Data read from the A/D data register (ADRL: \$017, ADRL: \$018) during A/D conversion cannot be guaranteed.

The A/D converter does not operate in the stop, watch, and subactive modes because of the OSC clock. During these low-power dissipation modes, current through the resistor ladder is cut off to decrease the power input.

Notes on Mounting

Assemble all parts including the HD404449 Series on a board, noting the points described below.

1. Connect layered ceramic type capacitors (about $0.1\ \mu\text{F}$) between AV_{CC} and AV_{SS} , between V_{CC} and GND, and between used analog pins and AV_{SS} .
2. Connect unused analog pins to AV_{SS} .

Figure 87 Example of Connections (1)

HD404449 Series

Between the V_{CC} and GND lines, connect capacitors designed for use in ordinary power supply circuits. An example connection is described in figure 88.

No resistors can be inserted in series in the power supply circuit, so the capacitors should be connected in parallel. The capacitors are a large capacitance C_1 and a small capacitance C_2 .

Figure 88 Example of Connections (2)

Programmable ROM (HD4074449)

The HD4074449 is a ZTAT™ microcomputer with built-in PROM that can be programmed in PROM mode.

PROM Mode Pin Description

MCU Mode			PROM Mode		MCU Mode			PROM Mode	
Pin No.	Pin Name	I/O	Pin Name	I/O	Pin No.	Pin Name	I/O	Pin Name	I/O

70	RB ₁	I/O			80	AN ₁	I				

- Notes: 1. I/O: Input/output pin, I: Input pin, O: Output pin
2. Each of O₀–O₄ has two pins; before using, each pair must be connected together.

Programming the Built-In PROM

The MCU's built-in PROM is programmed in PROM mode. PROM mode is set by pulling $\overline{\text{TEST}}$, $\overline{\text{M}}_0$, and $\overline{\text{M}}_1$ low, and RESET high as shown in figure 89. In PROM mode, the MCU does not operate, but it can be programmed in the same way as any other commercial 27256-type EPROM using a standard PROM programmer and an 80-to-28-pin socket adapter. Recommended PROM programmers and socket adapters of the HD4074449 are listed in table 31.

Since an HMCS400-series instruction is ten bits long, the HMCS400-series MCU has a built-in conversion circuit to enable the use of a general-purpose PROM programmer. This circuit splits each instruction into five lower bits and five upper bits that are read from or written to consecutive addresses. This means that if, for example, 16 kwords of built-in PROM are to be programmed by a general-purpose PROM programmer, a 32-kbyte address space (\$0000–\$7FFF) must be specified.

Warnings

1. Always specify addresses \$0000 to \$7FFF when programming with a PROM programmer. If address \$8000 or higher is accessed, the PROM may not be programmed or verified correctly. Set all data in unused addresses to \$FF.

Note that the plastic-package version cannot be erased or reprogrammed.

2. Make sure that the PROM programmer, socket adapter, and LSI are aligned correctly (their pin 1 positions match), otherwise overcurrents may damage the LSI. Before starting programming, make sure that the LSI is firmly fixed in the socket adapter and the socket adapter is firmly fixed onto the programmer.
3. PROM programmers have two voltages (V_{PP}): 12.5 V and 21 V. Remember that ZTAT™ devices require a V_{PP} of 12.5 V—the 21-V setting will damage them. 12.5 V is the Intel 27256 setting.

Programming and Verification

The built-in PROM of the MCU can be programmed at high speed without risk of voltage stress or damage to data reliability.

Programming and verification modes are selected as listed in table 30.

For details of PROM programming, refer to the following section, Notes on PROM Programming.

Table 30 PROM Mode Selection

Mode	Pin			
	$\overline{\text{CE}}$	$\overline{\text{OE}}$	V_{PP}	$\text{O}_0\text{--}\text{O}_7$
Programming	Low	High	V_{PP}	Data input
Verification	High	Low	V_{PP}	Data output
Programming inhibited	High	High	V_{PP}	High impedance

Figure 89 PROM Mode Connections

Addressing Modes

RAM Addressing Modes

The MCU has three RAM addressing modes, as shown in figure 90 and described below.

Figure 90 RAM Addressing Modes

Register Indirect Addressing Mode: The contents of the W, X, and Y registers (10 bits in total) are used as a RAM address. When the area from \$090 to \$25F is used, a bank must be selected by the bank register (V: \$03F).

Direct Addressing Mode: A direct addressing instruction consists of two words. The first word contains the opcode, and the contents of the second word (10 bits) are used as a RAM address.

HD404449 Series

Memory Register Addressing Mode: The memory registers (MR), which are located in 16 addresses from \$040 to \$04F, are accessed with the LAMR and XMRA instructions.

ROM Addressing Modes and the P Instruction

The MCU has four ROM addressing modes, as shown in figure 91 and described below.

Direct Addressing Mode: A program can branch to any address in the ROM memory space by executing the JMPL, BRL, or CALL instruction. Each of these instructions replaces the 14 program counter bits (PC_{13} – PC_0) with 14-bit immediate data.

Current Page Addressing Mode: The MCU has 64 pages of ROM with 256 words per page. A program can branch to any address in the current page by executing the BR instruction. This instruction replaces the eight low-order bits of the program counter (PC_7 – PC_0) with eight-bit immediate data. If the BR instruction is on a page boundary (address $256n + 255$), executing that instruction transfers the PC contents to the next physical page, as shown in figure 93. This means that the execution of the BR instruction on a page boundary will make the program branch to the next page.

Note that the HMCS400-series cross macroassembler has an automatic paging feature for ROM pages.

Zero-Page Addressing Mode: A program can branch to the zero-page subroutine area located at \$0000–\$003F by executing the CAL instruction. When the CAL instruction is executed, 6 bits of immediate data are placed in the six low-order bits of the program counter (PC_5 – PC_0), and 0s are placed in the eight high-order bits (PC_{13} – PC_6).

Table Data Addressing Mode: A program can branch to an address determined by the contents of four-bit immediate data, the accumulator, and the B register by executing the TBR instruction.

P Instruction: ROM data addressed in table data addressing mode can be referenced with the P instruction as shown in figure 92. If bit 8 of the ROM data is 1, eight bits of ROM data are written to the accumulator and the B register. If bit 9 is 1, eight bits of ROM data are written to the R1 and R2 port output registers. If both bits 8 and 9 are 1, ROM data is written to the accumulator and the B register, and also to the R1 and R2 port output registers at the same time.

The P instruction has no effect on the program counter.

Figure 91 ROM Addressing Modes

Figure 92 P Instruction

Figure 93 Branching when the Branch Destination is on a Page Boundary

Absolute Maximum Ratings

Item	Symbol	Value	Unit	Notes
Supply voltage	V_{CC}	-0.3 to +7.0	V	
Programming voltage	V_{PP}	-0.3 to +14.0	V	1
Pin voltage	V_T	-0.3 to ($V_{CC} + 0.3$)	V	
Total permissible input current	$\sum I_o$	100	mA	2
Total permissible output current	$-\sum I_o$	50	mA	3
Maximum input current	I_o	4	mA	4, 5
		30	mA	4, 6
Maximum output current	$-I_o$	4	mA	7, 8
Operating temperature	T_{opr}	-20 to +75	°C	
Storage temperature	T_{stg}	-55 to +125	°C	

Notes: Permanent damage may occur if these absolute maximum ratings are exceeded. Normal operation must be under the conditions stated in the electrical characteristics tables. If these conditions are exceeded, the LSI may malfunction or its reliability may be affected.

1. Applies to D_{13} (V_{PP}) of the HD4074449.
2. The total permissible input current is the total of input currents simultaneously flowing in from all the I/O pins to ground.
3. The total permissible output current is the total of output currents simultaneously flowing out from V_{CC} to all I/O pins.
4. The maximum input current is the maximum current flowing from each I/O pin to ground.
5. Applies to D_{10} , D_{11} , and R0-RC.
6. Applies to D_0 - D_9 .
7. The maximum output current is the maximum current flowing out from V_{CC} to each I/O pin.
8. Applies to D_0 - D_{11} and R0-RC.

HD404449 Series

Electrical Characteristics

DC Characteristics (HD404448, HD404449: $V_{CC} = 2.7$ to 6.0 V, $GND = 0$ V, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$; HD4074449: $V_{CC} = 2.7$ to 5.5 V, $GND = 0$ V, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$, unless otherwise specified)

Notes: 1. Output buffer current is excluded.

2. I_{CC1} and I_{CC2} are the source currents when no I/O current is flowing while the MCU is in reset state.

Test conditions:

MCU: Reset

Pins: RESET at V_{CC} ($V_{CC} - 0.3\text{ V}$ to V_{CC})
 $\overline{\text{TEST}}$ at V_{CC} ($V_{CC} - 0.3\text{ V}$ to V_{CC})

3. I_{SBY1} and I_{SBY2} are the source currents when no I/O current is flowing while the MCU timer is operating.

Test conditions:

MCU: I/O reset

Serial interface stopped

Standby mode

Pins: RESET at GND (0 V to 0.3 V)
 $\overline{\text{TEST}}$ at V_{CC} ($V_{CC} - 0.3\text{ V}$ to V_{CC})

4. Applies to HD404448 and HD404449.

5. Applies to HD4074449.

6. These are the source currents when no I/O current is flowing.

Test conditions:

Pins: RESET at GND (0 V to 0.3 V)

$\overline{\text{TEST}}$ at V_{CC} ($V_{CC} - 0.3\text{ V}$ to V_{CC})

D_{13} (V_{PP}) at V_{CC} ($V_{CC} - 0.3\text{ V}$ to V_{CC}) for the HD4074449

7. RAM data retention.

Item	Symbol	Pin(s)	Min	Typ	Max	Unit	Test Condition	Notes
Input capacitance	C_{in}	All pins except D ₁₃	—	—	15	pF	f = 1 MHz, V _{in} = 0 V	
		D ₁₃	—	—	15	pF	HD404448, HD404449: f = 1 MHz, V _{in} = 0 V	
			—	—	180	pF	HD4074449: f = 1 MHz, V _{in} = 0 V	

- Notes:
1. If the 32.768-kHz oscillator is used for the subsystem oscillator, f_{OSC} must be set as $0.4 \text{ MHz} \leq f_{OSC} \leq 1.0 \text{ MHz}$ or $1.6 \text{ MHz} \leq f_{OSC} \leq 4.0 \text{ MHz}$, and bit 1 of the system clock selector register (SSR: \$029) must be set to 0 or 1, respectively.
 2. The oscillation stabilization time is the period required for the oscillator to stabilize after V_{CC} reaches 2.7 V at power-on, or after RESET input goes high or STOPC input goes low when stop mode is cancelled. At power-on or when stop mode is cancelled, RESET or STOPC must be input for at least t_{RC} to ensure the oscillation stabilization time. If using a ceramic oscillator, contact its manufacturer to determine what stabilization time is required, since it will depend on the circuit constants and stray capacitances. Set bits 0 and 1 (MIS0, MIS1) of the miscellaneous register (MIS: \$00C) according to the system oscillation of the oscillation stabilization time.
 3. The oscillation stabilization time is the period required for the oscillator to stabilize after V_{CC} reaches 2.7 V at power-on, or after RESET input goes high or STOPC input goes low when the 32-kHz oscillator stops in stop mode and stop mode is cancelled. If using a crystal oscillator, contact its manufacturer to determine what stabilization time is required, since it will depend on the circuit constants and stray capacitances.
 4. Refer to figure 94.
 5. Refer to figure 95. The t_{cyc} unit applies when the MCU is in standby or active mode. The t_{subcyc} unit applies when the MCU is in watch or subactive mode.
 6. Refer to figure 96.
 7. Refer to figure 97.

HD404449 Series

Serial Interface Timing Characteristics (HD404448, HD404449: $V_{CC} = 2.7$ to 6.0 V, $GND = 0$ V, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$; HD4074449: $V_{CC} = 2.7$ to 5.5 V, $GND = 0$ V, $T_a = -20^\circ\text{C}$ to $+75^\circ\text{C}$, unless otherwise specified)

During Transmit Clock Output

Item	Symbol	Pin	Min	Typ	Max	Unit	Test Condition	Note
Transmit clock cycle time	$t_{S_{cyc}}$	$\overline{SCK}_1, \overline{SCK}_2$	1.0	—	—	t_{cyc}	Load shown in figure 99	1
Transmit clock high width	t_{SCKH}	$\overline{SCK}_1, \overline{SCK}_2$	0.5	—	—	t_{Scyc}	Load shown in figure 99	1
Transmit clock low width	t_{SCKL}	$\overline{SCK}_1, \overline{SCK}_2$	0.5	—	—	t_{Scyc}	Load shown in figure 99	1
Transmit clock rise time	t_{SCKr}	$\overline{SCK}_1, \overline{SCK}_2$	—	—	200	ns	Load shown in figure 99	1
Transmit clock fall time	t_{SCKf}	$\overline{SCK}_1, \overline{SCK}_2$	—	—	200	ns	Load shown in figure 99	1
Serial output data delay time	t_{DSO}	SO_1, SO_2	—	—	500	ns	Load shown in figure 99	1
Serial input data setup time	t_{SSI}	SI_1, SI_2	300	—	—	ns	—	1
Serial input data hold time	t_{HSI}	SI_1, SI_2	300	—	—	ns	—	1

Note: 1. Refer to figure 98.

During Transmit Clock Input

Item	Symbol	Pin	Min	Typ	Max	Unit	Test Condition	Note
Transmit clock cycle time	$t_{S_{cyc}}$	$\overline{SCK}_1, \overline{SCK}_2$	1.0	—	—	t_{cyc}	—	1
Transmit clock high width	t_{SCKH}	$\overline{SCK}_1, \overline{SCK}_2$	0.5	—	—	t_{Scyc}	—	1
Transmit clock low width	t_{SCKL}	$\overline{SCK}_1, \overline{SCK}_2$	0.5	—	—	t_{Scyc}	—	1
Transmit clock rise time	t_{SCKr}	$\overline{SCK}_1, \overline{SCK}_2$	—	—	200	ns	—	1
Transmit clock fall time	t_{SCKf}	$\overline{SCK}_1, \overline{SCK}_2$	—	—	200	ns	—	1
Serial output data delay time	t_{DSO}	SO_1, SO_2	—	—	500	ns	Load shown in figure 99	1
Serial input data setup time	t_{SSI}	SI_1, SI_2	300	—	—	ns	—	1
Serial input data hold time	t_{HSI}	SI_1, SI_2	300	—	—	ns	—	1

Note: 1. Refer to figure 98.

Notes on ROM Out

Please pay attention to the following items regarding ROM out.

On ROM out, fill the ROM area indicated below with 1s to create the same data size as a 16-kword version (HD404449). A 16-kword data size is required to change ROM data to mask manufacturing data since the program used is for a 16-kword version.

This limitation applies when using an EPROM or a data base.

HD404449 Series

HD404448, HD404449 Option List

Please check off the appropriate applications and enter the necessary information.

1. ROM size

<input type="checkbox"/> HD404448	8-kword
<input type="checkbox"/> HD404449	16-kword

Date of order	
Customer	
Department	
Name	
ROM code name	
LSI number	HD40444

2. Optional Functions

* <input type="checkbox"/> With 32-kHz CPU operation, with time-base for clock
* <input type="checkbox"/> Without 32-kHz CPU operation, with time-base for clock
<input type="checkbox"/> Without 32-kHz CPU operation, without time-base

Note: * Options marked with an asterisk require a subsystem crystal oscillator (X1, X2).

3. ROM code media

Please specify the first type below (the upper bits and lower bits are mixed together), when using the EPROM on-package microcomputer type (including ZTAT™ version).

<input type="checkbox"/> EPROM: The upper bits and lower bits are mixed together. The upper five bits and lower five bits are programmed to the same EPROM in alternating order (i.e., LULULU...).
<input type="checkbox"/> EPROM: The upper bits and lower bits are separated. The upper five bits and lower five bits are programmed to different EPROMS.

4. Oscillator for OSC1 and OSC2

<input type="checkbox"/> Ceramic oscillator	f =	MHz
<input type="checkbox"/> Crystal oscillator	f =	MHz
<input type="checkbox"/> External clock	f =	MHz

5. Stop mode

<input type="checkbox"/> Used
<input type="checkbox"/> Not used

6. Package

<input type="checkbox"/> FP-80A
<input type="checkbox"/> TFP-80F

Cautions

1. Hitachi neither warrants nor grants licenses of any rights of Hitachi's or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Hitachi bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
 2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
 3. Hitachi makes every attempt to ensure that its products are of high quality and reliability. However, contact Hitachi's sales office before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
 4. Design your application so that the product is used within the ranges guaranteed by Hitachi particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Hitachi bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Hitachi product does not cause bodily injury, fire or other consequential damage due to operation of the Hitachi product.
 5. This product is not designed to be radiation resistant.
 6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Hitachi.
 7. Contact Hitachi's sales office for any questions regarding this document or Hitachi semiconductor products.
