

LOW NOISE 150mA LDO REGULATOR R1111N SERIES

■ OUTLINE

The R1111N Series are voltage regulator ICs with high output voltage accuracy, extremely low supply current, low ON-resistance, and high Ripple Rejection by CMOS process. Each of these voltage regulator ICs consists of a voltage reference unit, an error amplifier, resistors, a current limit circuit, and a chip enable circuit.

These ICs perform with low dropout voltage and a chip enable function. The line transient response and load transient response of the R1111N Series are excellent, thus these ICs are very suitable for the power supply for hand-held communication equipment.

The output voltage of these ICs is fixed with high accuracy. Since the package for these ICs are SOT-23-5 (Mini-mold) package, high density mounting of the ICs on boards is possible.

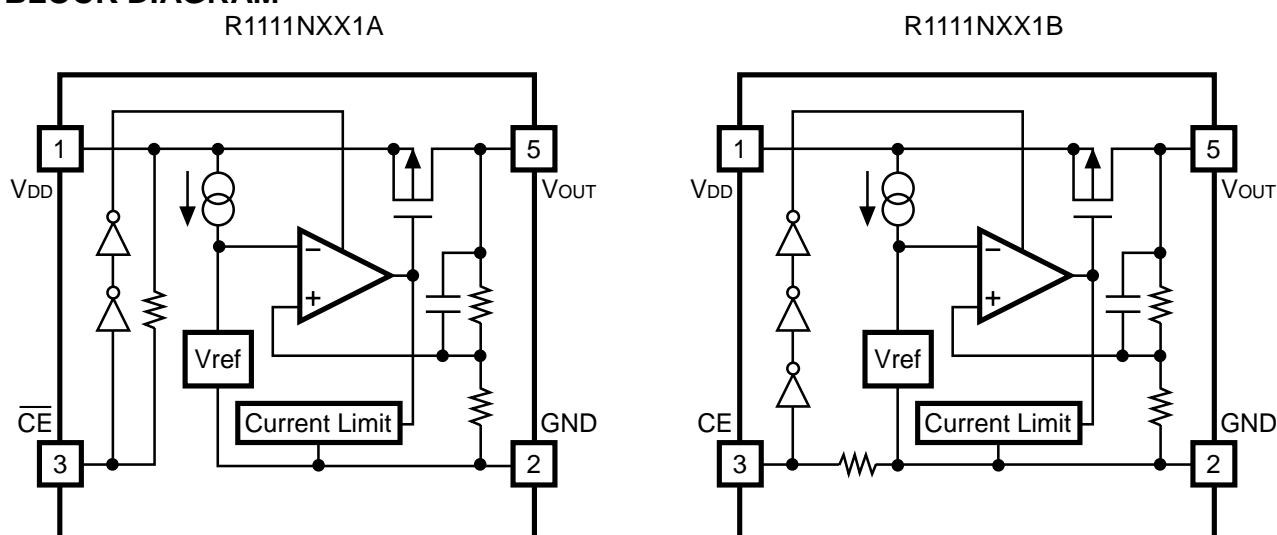

■ FEATURES

- Ultra-Low Supply Current.....TYP. 35 μ A
- Standby ModeTYP. 0.1 μ A
- Low Dropout VoltageTYP. 0.2V($I_{OUT}=100$ mA)
- High Ripple RejectionTYP. 70dB($f=1$ kHz)
- Low Temperature-Drift Coefficient of
- Output Voltage.....TYP. ± 100 ppm/ $^{\circ}$ C
- Excellent Line RegulationTYP. 0.05%/V
- High Output Voltage Accuracy..... $\pm 2.0\%$
- Excellent Line Transient Response and Load Transient Response
- Small PackageSOT-23-5(Mini-mold)
- Output Voltage.....Stepwise setting with a step of 0.1V in the range of 1.5V to 5.0V is possible
- Built-in chip enable circuit (2 types; A: "L" active, B: "H" active)
- PinoutSimilar to the LP2980

■ APPLICATIONS

- Power source for cellular phones such as GSM,CDMA and various kind of PCSs.
- Power source for electrical appliances such as cameras, VCRs and camcorders.
- Power source for battery-powered equipment.

SELECTION GUIDE

The output voltage, the active type, the packing type, and the taping type for the ICs can be selected at the user's request. The selection can be made by designating the part number as shown below :

R1111XXX1X-XX ←Part Number
 ↑ ↑ ↑ ↑
 a b c d

Code	Contents
a	Designation of Package Type : N:SOT-23-5 (Mini-mold)
b	Setting Output Voltage (V _{OUT}) : Stepwise setting with a step of 0.1V in the range of 1.5V to 5.0V is possible.
c	Designation of Active Type : A :“L” active type B :“H” active type
d	Designation of Taping Type : Ex. TR, TL (refer to Taping Specifications ;TR type is the standard direction.)

■ OPERATION

R1111NXX1A

R1111NXX1B

In these ICs, fluctuation of Output Voltage, V_{OUT} is detected by Feed-back Registers R1, R2, and the result is compared with a reference voltage by Error Amplifier, so that a constant voltage is output. A current limit circuit for Protection at short mode and a chip enable circuit are included.

TECHNICAL NOTES

When using these ICs, consider the following points:

In these ICs, phase compensation is made for securing stable operation even if the load current is varied. For this purpose, be sure to use a capacitor COUT with good frequency characteristics and ESR (Equivalent Series Resistance) of which is in the range described as follows:

Measuring Circuit for white noise; R1111N301B

The relations between IOUT (Output Current) and ESR of Output Capacitor are shown below. The conditions when the white noise level is under 40μV(Avg.) are marked as the hatched area in the graph.

(note: When the additional ceramic capacitors are connected to the Output Pin with Output capacitor for phase compensation, the operation might be unstable. Because of this, test these ICs with as same external components as ones to be used on the PCB.)

<measuring conditions>

- (1) VIN=4V
- (2) Frequency band :10Hz to 1MHz
- (3) Temperature : 25°C

- Make VDD and GND line sufficient. When the impedance of these is high, the noise might be picked up or not work correctly.
- Connect the capacitor with a capacitance of 1μF or more between VDD and GND as close as possible.
- Set external components, especially Output Capacitor, as close as possible to the ICs and make wiring shortest.
