## NOTES

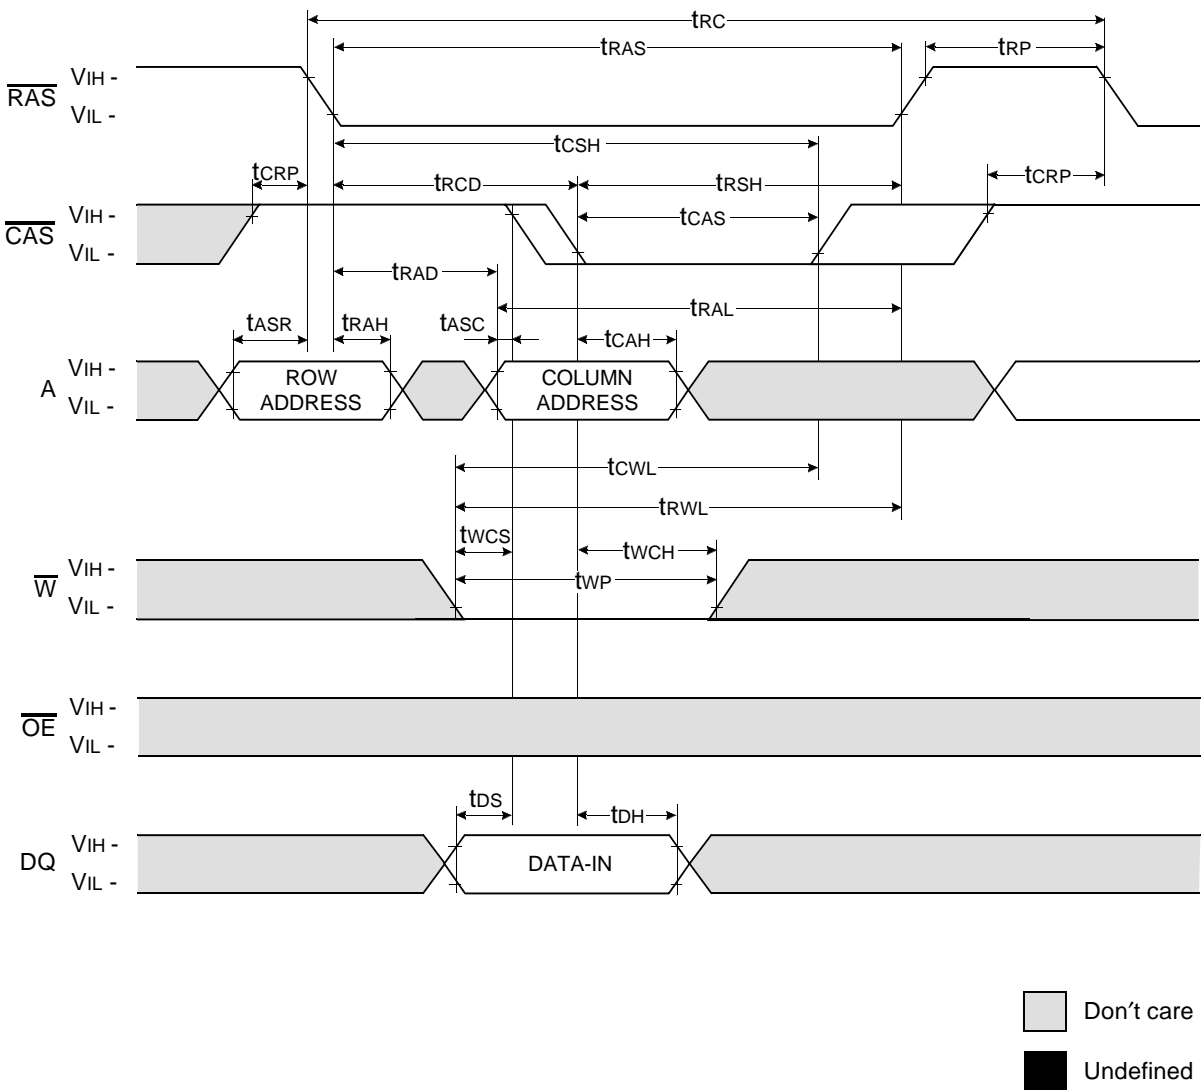

1. An initial pause of 200us is required after power-up followed by any 8  $\overline{\text{RAS}}$ -only or  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycles before proper device operation is achieved.
2. Input voltage levels are V<sub>IH</sub>/V<sub>IL</sub>. V<sub>IH</sub>(min) and V<sub>IL</sub>(max) are reference levels for measuring timing of input signals. Transition times are measured between V<sub>IH</sub>(min) and V<sub>IL</sub>(max) and are assumed to be 5ns for all inputs.
3. Measured with a load equivalent to 2 TTL loads and 100pF.
4. Operation within the t<sub>RC</sub>D(max) limit insures that t<sub>RC</sub>A(max) can be met. t<sub>RC</sub>D(max) is specified as a reference point only. If t<sub>RC</sub>D is greater than the specified t<sub>RC</sub>D(max) limit, then access time is controlled exclusively by t<sub>RC</sub>A.
5. Assumes that t<sub>RC</sub>D≥t<sub>RC</sub>D(max).
6. This parameter defines the time at which the output achieves the open circuit and is not referenced for V<sub>OH</sub> or V<sub>OL</sub>.
7. twcs is non-restrictive operating parameter. It is included in the data sheet as electrical characteristics only. If twcs≥twcs(min), the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle.
8. Either t<sub>RC</sub>H or t<sub>RR</sub>H must be satisfied for a read cycle.
9. These parameters are referenced to the  $\overline{\text{CAS}}$  leading edge in early write cycles.
10. Operation within the t<sub>RAD</sub>(max) limit insures that t<sub>RC</sub>A(max) can be met. t<sub>RAD</sub>(max) is specified as reference point only. If t<sub>RAD</sub> is greater than the specified t<sub>RAD</sub>(max) limit access time is controlled by t<sub>AA</sub>.
11. t<sub>ASC</sub>≥6ns, Assume t<sub>T</sub>=2.0ns.
12. If  $\overline{\text{RAS}}$  goes high before  $\overline{\text{CAS}}$  high going, the open circuit condition of the output is achieved by  $\overline{\text{CAS}}$  high going. If  $\overline{\text{CAS}}$  goes high before  $\overline{\text{RAS}}$  high going, the open circuit condition of the output is achieved by  $\overline{\text{RAS}}$  going.
