## M381L1713BT0 DDR SDRAM 184pin DIMM

16Mx72 DDR SDRAM 184pin DIMM based on 16Mx8

### GENERAL DESCRIPTION

The Samsung M381L1713BT0 is 16M bit x 72 Double Data Rate SDRAM high density memory modules based on first gen. of 128Mb DDR SDRAM respectively. The Samsung M381L1713BT0 consists of nine CMOS 16M x 8 bit with 4banks Double Data Rate SDRAMs in 66pin TSOP-II(400mil) packages mounted on a 184pin glass-epoxy substrate. Four 0.1uF decoupling capacitors are mounted on the printed circuit board in parallel for each DDR SDRAM. The M381L1713BT0 is Dual In-line Memory Modules and intended for mounting into 184pin edge connector sockets.

Synchronous design allows precise cycle control with the use of system clock. Data I/O transactions are possible on both edges of DQS. Range of operating frequencies, programmable latencies and burst lengths allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

## ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Voltage on any pin relative to Vss	V <sub>IN</sub> , V <sub>OUT</sub>	-0.5 ~ 3.6	V
Voltage on VDD supply relative to Vss	VDD	-1.0 ~ 4.6	V
Voltage on VDDQ supply relative to Vss	VDDQ	-0.5 ~ 3.6	V

Power dissipation	P <sub>D</sub>	9	W
Short circuit current	I <sub>OS</sub>	50	mA

**Note :** Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.

Functional operation should be restricted to recommended operating condition.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

## POWER &amp; DC OPERATING CONDITIONS (SSTL\_2 In/Out)

Recommended operating conditions(Voltage referenced to Vss=0V, TA=0 to 70°C)

Parameter	Symbol	Min	Max	Unit	Note

I/O Reference voltage	VREF	0.49*VDDQ	0.51*VDDQ	V	1
I/O Termination voltage(system)	V <sub>TT</sub>	VREF-0.04	VREF+0.04	V	2
Input logic high voltage	V <sub>IH</sub> (DC)	VREF+0.15	VDDQ+0.3	V	
Input logic low voltage	V <sub>IL</sub> (DC)	-0.3	VREF-0.15	V	
Input Voltage Level, CK and $\overline{\text{CK}}$ inputs	V <sub>IN</sub> (DC)	-0.3	VDDQ+0.3	V	
Input Differential Voltage, CK and $\overline{\text{CK}}$ inputs	V <sub>ID</sub> (DC)	0.3	VDDQ+0.6	V	3
Input leakage current	I <sub>I</sub>	-2	2	uA

Output Low Current (V <sub>OUT</sub> = 0.35V)	I <sub>OL</sub>	16.8		mA	

**Notes** 1. VREF is expected to be equal to 0.5\*VDDQ of the transmitting device, and to track variations in the DC level of the same. Peak-to-peak noise on VREF may not exceed 2% of the DC value

2. V<sub>TT</sub> is not applied directly to the device. V<sub>TT</sub> is a system supply for signal termination resistors, is expected to be set equal to VREF, and must track variations in the DC level of VREF

3. V<sub>ID</sub> is the magnitude of the difference between the input level on CK and the input level on  $\overline{\text{CK}}$ .

**Note :** 1. Maximum burst refresh of 8

2. tHZQ transitions occurs in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving.
3. The specific requirement is that DQS be valid(High or Low) on or before this CK edge. The case shown(DQS going from High\_Z to logic Low) applies when no writes were previously in progress on the bus. If a previous write was in progress, DQS could be High at this time, depending on tDQSS.
4. The maximum limit for this parameter is not a device limit. The device will operate with a great value for this parameter, but system performance (bus turnaround) will degrade accordingly.
5. The value of tQCSW min. is 1.25ns from the last low going data strobe edge to  $\overline{\text{QFC}}$  high. And the value of tQCSW max. is 0.5tCK from the first high going clock edge after the last low going data strobe edge to  $\overline{\text{QFC}}$  high.
6. the value of tQCSWI max. is 1.5tCK from the first high going clock edge after the last low going data strobe edge to  $\overline{\text{QFC}}$  high.
7. A write command can be applied with tRCD satisfied after this command.

**Note :** 1. OP Code : Operand Code. A0 ~ A11 & BA0 ~ BA1 : Program keys. (@EMRS/MRS)

2. EMRS/ MRS can be issued only at all banks precharge state.

A new command can be issued 2 clock cycles after EMRS or MRS.

3. Auto refresh functions are same as the CBR refresh of DRAM.

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at all banks precharge state.

4. BA0 ~ BA1 : Bank select addresses.

If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.

If both BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank B is selected.

If both BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank C is selected.

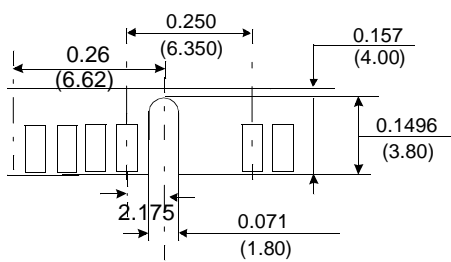

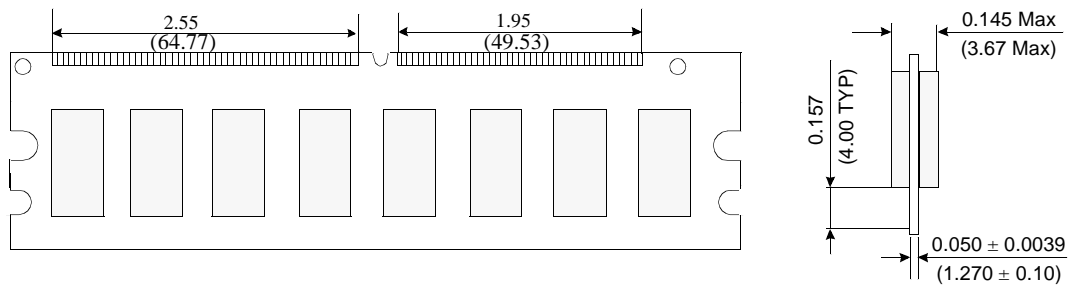

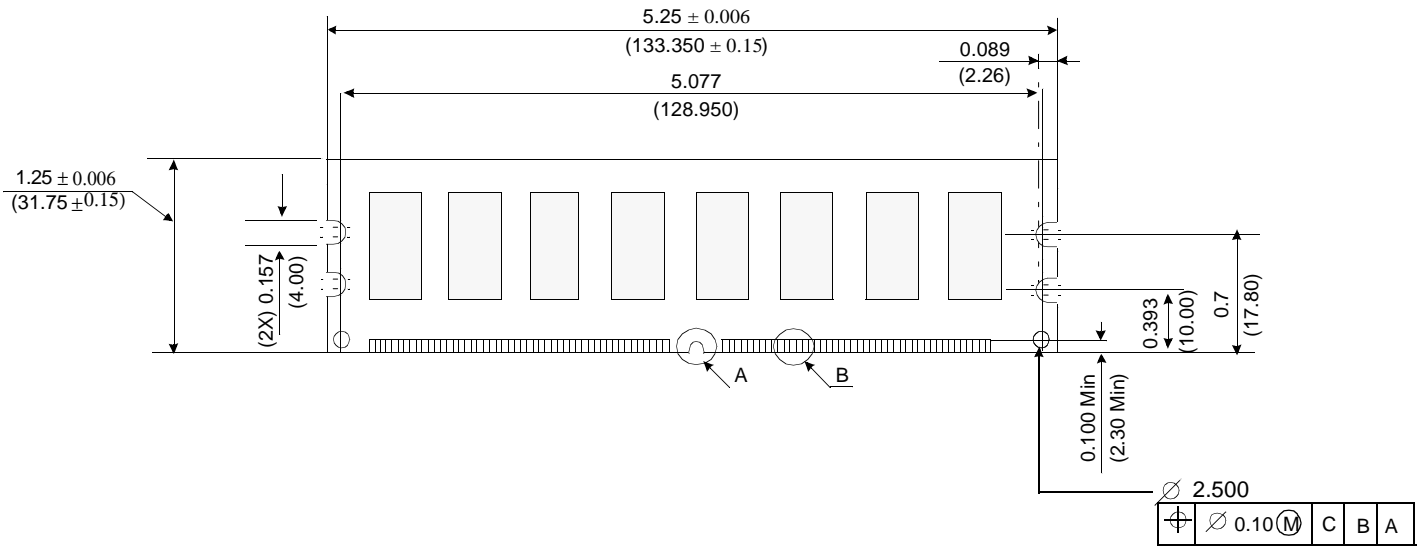

If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.

5. If A10/AP is "High" at row precharge, BA0 and BA1 are ignored and all banks are selected.

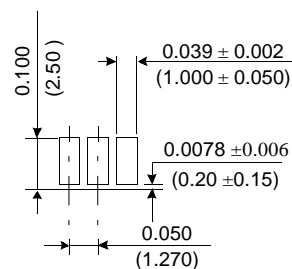

6. During burst write with auto precharge, new read/write command can not be issued.  
Another bank read/write command can be issued after the end of burst.  
New row active of the associated bank can be issued at tRP after the end of burst.
7. Burst stop command is valid at every burst length.
8. DM sampled at the rising and falling edges of the DQS and Data-in are masked at the both edges (Write DM latency is 0).
9. This combination is not defined for any function, which means "No Operation(NOP)" in DDR SDRAM.
