LA8632, LA8632M**Low-voltage, Low-current Compander**

OVERVIEW

The LA8632 and LA8632M are low-voltage, low-current compander ICs for battery-powered, cordless telephone applications.

The LA8632 and LA8632M feature a good signal-to-noise ratio and a high dynamic range at voice-signal frequencies. The output compression is given by $V_o = 0.5 \log V_i$, and the expansion, by the inverse operation.

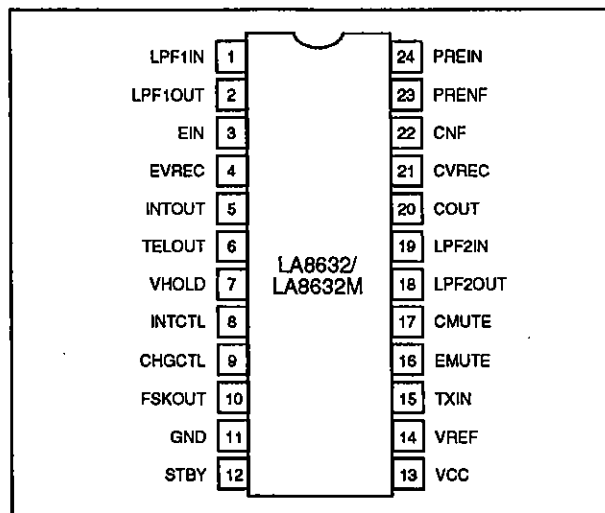

The LA8632 and LA8632M also feature an FSK comparator for receiving FSK-modulated digital data, a microphone amplifier, selectable intercom or telephone operation expander outputs, and an output mute control.

The LA8632 and LA8632M operate from a 2.4 to 6.0 V supply and are available in 24-pin DIPs and 24-pin MFPs.

DESIGN NOTES

The gain of the compressor summing amplifier is two at DC, and undefined at AC. The cutoff frequency is determined by the RC network formed by the external capacitor connected to CNF and the internal 30 kΩ resistor.

The expander output is on TEOUT when INTCTL is HIGH or open, and on INTOUT when LOW.

In FSK waveform reconstruction, LOW-level output is during the positive signal interval of a cycle.

Compression

Figure 1. Compressor equivalent circuit

The compressor output voltage is given by the equation

$$V_O = \sqrt{\frac{R_5 R_6 I_2}{3 R_4}} V_{in} = 0.316 \times \sqrt{V_I}$$

where I_2 is half the common-mode current of the VCA voltage-to-current converter differential amplifier.

Expansion

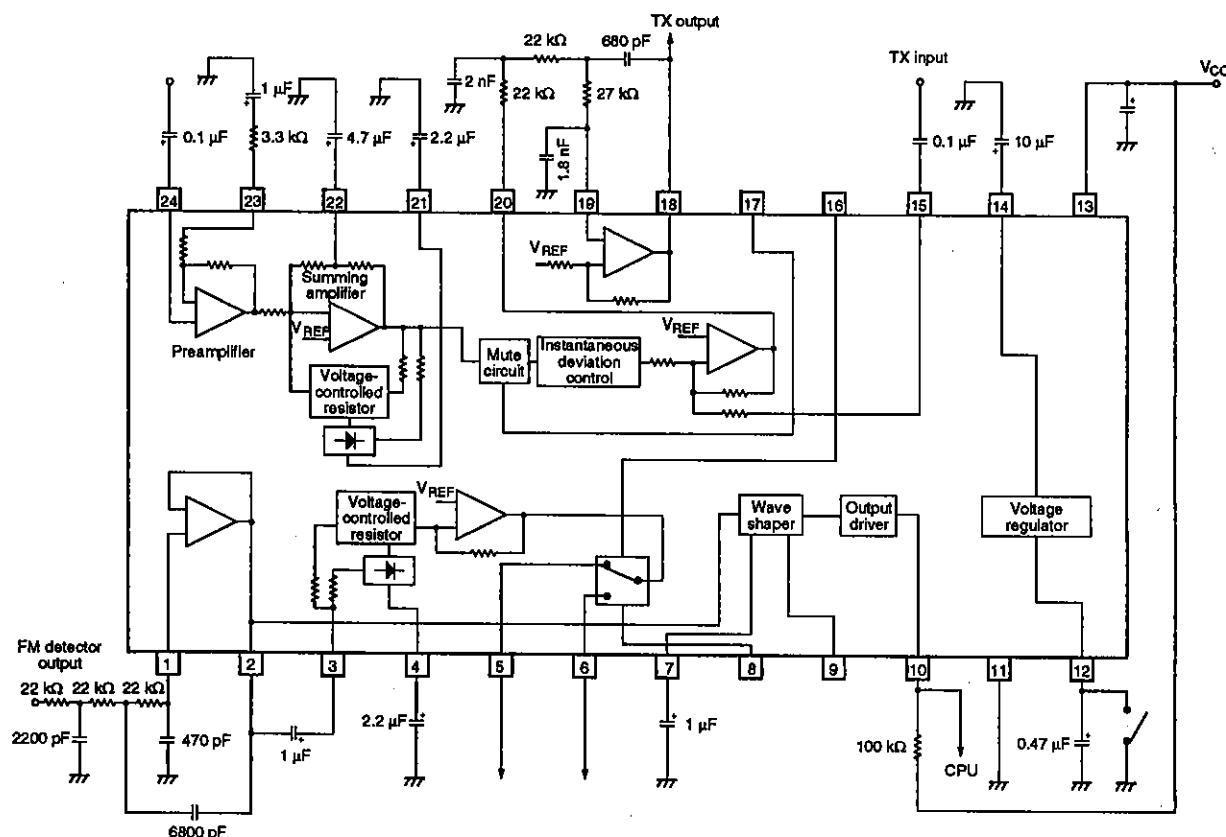

Figure 2. Expander equivalent circuit

The expander output voltage is given by the equation

$$V_O = \frac{3 R_3}{R_1 R_2 I_1} V_I^2 = 10 \times V_I^2$$

where I_1 is half the common-mode current of the VCA voltage-to-current converter differential amplifier.
