	No. 3491A	<b>LC66404A, 66406A, 66408A</b>
		<b>4K/6K/8K-BYTE ROM-CONTAINED SINGLE-CHIP 4-BIT MICROCOMPUTER FOR CONTROL-ORIENTED APPLICATIONS</b>

### General Description

The LC66404A, 66406A, 66408A are 42-pin package type CMOS 4-bit single-chip microcomputers. They contain a ROM, a RAM, I/O ports, a dual 8-bit serial interface, A/D converter input, a 12-bit timer, an 8-bit timer, and provide 8 interrupt sources with 8 vector addresses.

### Features

- (1) On-chip 4K-byte/6K-byte/8K-byte ROM, 512x4-bit RAM
- (2) Instruction set with 128 instructions common with the LC665XX series
- (3) I/O ports ----- 36 pins
- (4) 8-bit serial interface ----- 2 lines (16-bit cascade connection available)
- (5) Minimum instruction cycle time ----- 0.92 $\mu$ s (4.3MHz external clock input mode)
- (6) Powerful timer function and prescaler  
12-bit timer-used interval timer, event counter, pulse width measurement, burst pulse output  
8-bit timer-used interval timer, event counter, PWM output, burst pulse output  
12-bit prescaler-used time base function
- (7) A/D converter  
6-bit, 6-channel
- (8) Powerful 8-source 8-vector interrupt function  
External interrupt: 3 sources, 3 vector addresses  
Internal interrupt: 5 sources, 5 vector addresses (timer: 2 sources, serial I/O: 2 sources, prescaler)
- (9) Flexible I/O function  
A/D converter input, 20mA drive output, 15V breakdown voltage, pull-up/open drain selectable by option
- (10) Runaway detection function (option)
- (11) 8-bit input/output function
- (12) HALT/HOLD mode-used power-down function
- (13) Package: DIP42S, QFP48E (QIP48E)
- (14) Evaluation LSI: LC66599 (evaluation chip) + EVA850/800-TB6640X, LC66E408 (microcomputer with EPROM)

Remarks: Output with Pu MOS ----- Output with pull-up MOS transistor  
 CMOS output ----- Complementary output  
 OD output ----- Open drain output

**User Options****(1) Options of ports 0, 1 output level during reset**

For input/output ports 0, 1 either of the following two output levels may be selected in a group of 4 bits during reset by option

Option Name	Conditions, etc.
1. Output during reset: "H" level	All of 4 bits of ports 0, 1
2. Output during reset: "L" level	All of 4 bits of ports 0, 1

**(2) Oscillator Circuit Options**

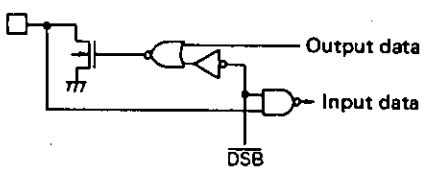

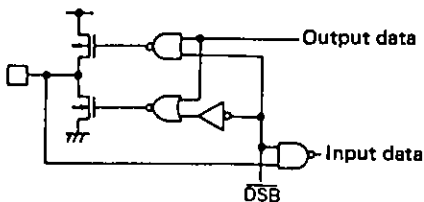

Option Name	Circuit	Conditions, etc.
1. External clock		• Input: Schmitt type
2. 2-pin RC OSC		• Input: Schmitt type
3. Ceramic resonator OSC		

**(3) Watchdog timer option**

The presence or absence of the runaway detection function (watchdog timer) may be selected by option.

**(4) Options of port output configuration**

For each port of P0, P1, P2, P3 (except P33/HOLD), P4, P5, P6, PC, either of the following two output configurations may be selected by option (in bit units).

Option Name	Circuit	Conditions, etc.
1. Open drain type output		P2, P3, P5, P6: Schmitt input
2. Output with pull-up resistance		P2, P3, P5, P6: Schmitt input CMOS output (P2, P3, P6, PC) or Pu MOS output (P0, P1, P4, P5) is selected according to Pch Tr drive capacity.

## Main Specifications

Storage Temperature	Tstg			-55 to +125	$^{\circ}\text{C}$	

(Note 1) Applicable only when the open drain output type is selected. If other type than the open drain output is selected, the specification indicated in the column for other pins applies.

(Note 2) For OSC input/output, up to self OSC level is allowable.

(Note 3) Sink current

(Note 4) Source current (applicable only when the pull-up output type or CMOS output type is selected)

(Note 5) Reflow soldering is recommended for QFP packages.

Please consult your local representative for information on solder-bath immersion of the device.

(2) Allowable Operating Conditions at  $T_a=-30$  to  $+70^{\circ}\text{C}$ ,  $V_{SS}=0\text{V}$  unless otherwise specified

#### RC OSC Characteristic of the LC66404A, 66406A, 66408A

Fig. 8 shows the RC OSC characteristic of the LC66404A, 66406A, 66408A. For the variation range of RC OSC frequency of the LC66404A, 66406A, 66408A, the following are guaranteed at the external constants only shown below.

External constants  $C_{ext}=100pF$ ,  $R_{ext}=2.7k\Omega$   
 $2.0MHz \leq f_{RC} \leq 4.0MHz$  ( $T_a=-30^\circ C$  to  $+70^\circ C$ ,  $V_{DD}=4.0$  to  $6.0V$ )

If any other constants than specified above are used, RC oscillation frequency data (typ.) must be observed. (See Fig. 8.)

(Note 10) The OSC frequency at  $V_{DD}=4.0$  to  $6.0V$ ,  $T_a=-30$  to  $+70^\circ C$  must be within the operation clock frequency range (0.4 to 4.3MHz).

## Application Development Tools

The programs for the LC66404A, 66406A, 66408A microcomputers can be developed on the MS-DOS personal computer system (IBM-PC model system). Cross assembler for this system is provided. To help the user develop programs for the LC66404A, 66406A, 66408A microcomputers, the following development tools are prepared:

Appearance of Application Development Tools

## (1) Program debugging unit (EVA850/800)

The program debugging unit (EVA850/800) is an emulator that includes the EPROM WRITE function and the serial data communications interface function between the unit itself and external systems (host computer, etc.). Application programs can be developed, corrected, and debugged at the machine language level. The debugging function can be carried out through break, step and trace operations. (Use the MPM6640X as the monitor ROM on the EVA850/800 debugging unit.)

## (2) Evaluation chip board (EVA850/800-TB6640X)

The evaluation chip board sends control signals to the user application board through the 42-pin connector. Data is transferred between the I/O ports on the evaluation chip board and the user application board through the 42-pin connector. If the LC66599 evaluation chip is connected to the 42-pin plug by the output cable, the data from the LC66599 microcomputer is converted into the LC66404A, 66406A, 66408A-bound data by the plug. There are jumper connectors on the evaluation chip board. They are used to select options and status levels. Therefore, using these jumper connectors, the same input/output formats and functions as those of the LC66404A, 66406A, 66408A microcomputers can be selected on the evaluation chip board.

## Jumpers

Type	OSC		Reset type selection		Power supply to the user application board through the evaluation chip board	
Jumper name	Jumper 1 (J1)		Jumper 2 (J2)		Jumper 3 (J3)	
Jumper setting and mode	EXT	External clock	INT	Reset by the RUN instruction from the host computer.	ON	VDD supply to the user application board through the evaluation chip board output.
	RC	RC OSC				
	CF	CF OSC	EXT	Reset by the reset circuit on the user application board	OFF	Power supply to the user application board from an independent power source (from the evaluation chip board)

## Switch 9 to 11 (SW9 to SW11)

Type	Output level selection for ports 0,1 at the reset				Watchdog timer function selection	
Switch name	P0HL (SW11)		P1HL (SW10)		WDC (SW9)	
Switch setting and mode	+5V	Port 0 "H"	+5V	Port 1 "H"	+5V	Watchdog timer function selected
	GND	Port 0 "L"	GND	Port 1 "L"	GND	Watchdog timer function not selected

(Note) There are many other switches on the evaluation chip board. For further details, refer to the description of "Section 4. Operation" in "EVA 850/800-LC6640X Development Tool Manual".

Switches SW1 to SW8: Pull-up resistor option select

- ① Set to ON when on-chip pull-up resistor is used. Set to OPEN when open drain output type is selected.
- ② Selectable for each pin.

## (3) Cross assembler

Cross assembler name (File name)	Target machine	Restriction on program development
LC66S.EXE	LC66404A, 66406A, 66408A(LC66E408/P408) (LC66599)	Restriction on SB instruction • LC66404A : SB 0 only usable • LC66406A/408A : SB 0, SB 1 usable (LC66E408/P408) • (LC66599) : SB 0, SB 1, SB 2, SB 3 usable

## (4) Simulation chip (For details, refer to the catalog of the LC66E408.)

The simulation chip (LC66E408) is an EPROM-contained microcomputer. Using the dedicated conversion board (DIP: W66EP308D/408D, FLP: W66EP308Q/408Q), you can write programs in the EPROM with a commercially available PROM writer. Then, you can incorporate the simulation chip into an application product to monitor actual operations.

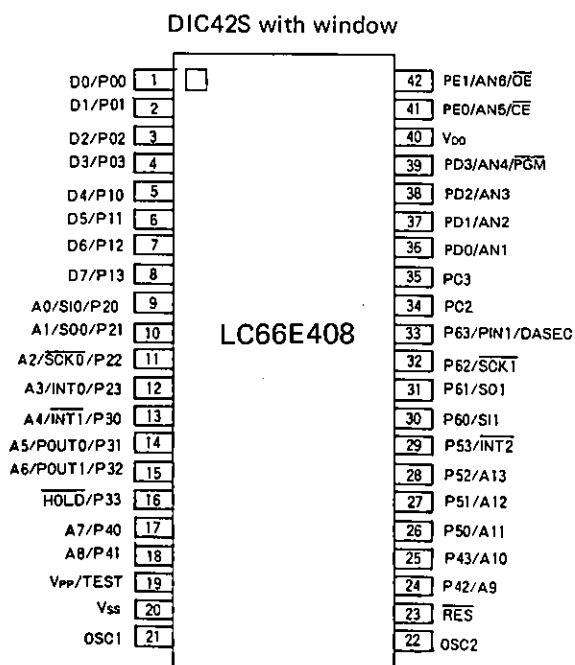

## ① Case outline

The LC66E408 is the same as the LC66404A, 66406A, 66408A in pin assignment and functions. The pin assignment is shown below.

## ② Option

Using the on-chip EPROM data (option data area and definition are shown on the next page), you can specify the options (level at port 0, 1 reset mode, watchdog timer, port output configuration) of a microcomputer to be evaluated. Thus, you can perform evaluation using the same peripheral as the board of the equipment to be mass-produced.

## Remarks:

PU --- Pull-up MOS type resistance output

OD --- Open drain output

Note: The pull-up MOS type resistance output represents the pull-up MOS (PU MOS) type resistor output circuit and the complementary MOS (CMOS) type output circuit.
