## Single-Chip Electronic Volume Control System

### Overview

The LC75394NE is an electronic volume control system providing control over volume, balance, 5-band equalizer, and input switching based on serial inputs.

### Functions

- Volume control:  
The chip provides 25 levels of volume attenuation: in 2-dB steps between 0 dB and -20 dB, 3-dB steps between -20 dB and -32 dB, 4-dB steps between -32 dB and -52 dB, 4.5-dB steps between -52 dB and -70 dB, and  $-\infty$ . Independent control over left and right channels provides balance control.
- Equalizer:  
The chip provides control in 2-dB steps over the range between +10 dB and -10 dB. Four of the five bands have peaking equalization; the remaining one, shelving equalization.
- Selector:  
The left and right channels each offer a choice of four inputs. An external constant determines the amplification for the input signal.

### Features

- Built-in buffer amplifiers reduce the number of external parts necessary.
- Silicon gate CMOS reduces switching noise.
- Serial data input  
—Supports CCB\* format communication with the system controller.
- A built-in reference voltage circuit divides the supply voltage ( $V_{DD}$ ) in half.

### Package Dimensions

## Equalizer Control Block Internal Equivalent Circuit (Bands F1 to F4)

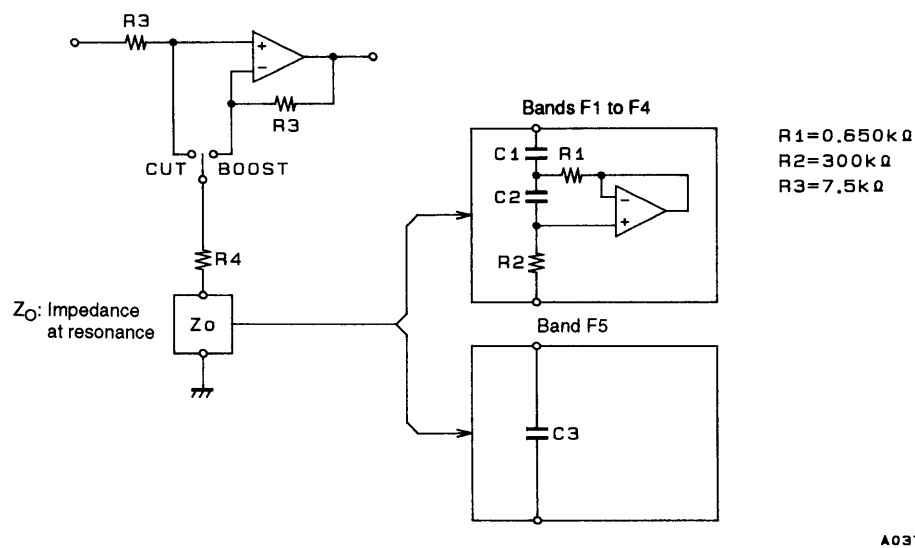

## Calculating the Size of External Capacitors

The LC75394NE supports four bands with peaking characteristics and one band with shelving characteristics

### 1. Peaking Characteristics (bands F1 to F4)

The external capacitor functions as the structural element of a simulated inductor. The equivalent circuit and the calculations required to achieve the desired center frequency are shown below.

- Equivalent circuit for the simulated inductor

- Calculation example

Specifications: Central frequency,  $F_O = 107 \text{ Hz}$

Q factor at maximum boost,  $Q_{+10 \text{ dB}} = 0.8$

— Calculate  $Q_O$ , the sharpness of the simulated inductance itself.

$$Q_O = (R1 + R4)/R1 \times Q_{+10 \text{ dB}} \\ \neq 4.270$$

Note: R4 is from the separately issued internal block diagram.

— Calculate C1

$$C1 = 1/2\pi F_O R1 Q_O \neq 0.536 \text{ (}\mu\text{F)}$$

— Calculate C2

$$C2 = Q_O/2\pi F_O R2 \neq 0.021 \text{ (}\mu\text{F)}$$

- Sample results

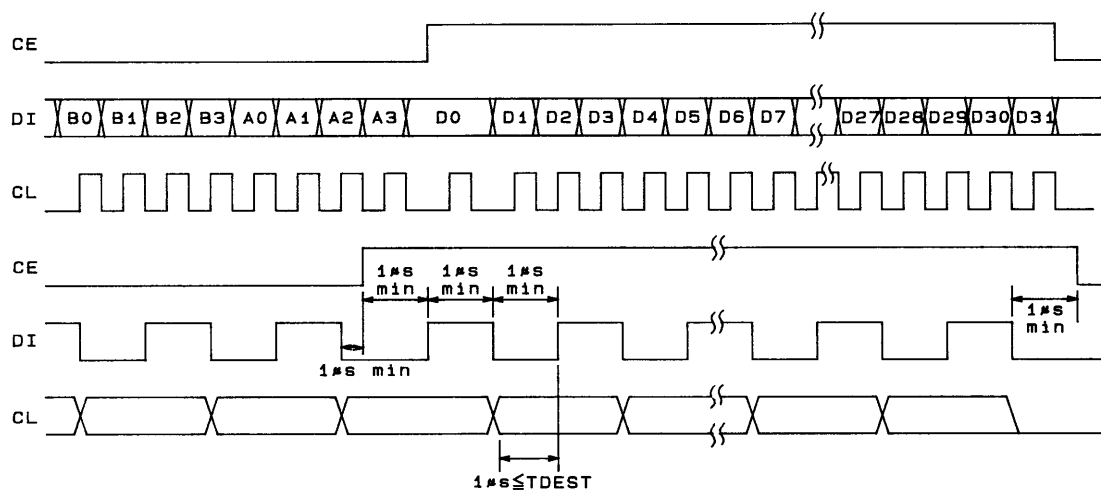

Central frequency $F_O$ (Hz)	C1 (F)	C2 (F)
107	0.536 $\mu$	0.021 $\mu$
340	0.169 $\mu$	6663 p
1070	0.054 $\mu$	2117 p
3400	0.017 $\mu$	666 p

- Shelving characteristics (Band F5)

Achieving the desired control of 2-dB steps over the range between +10 dB to –10 dB requires choosing a capacitor, C3, with an impedance of 650  $\Omega$ .

## Control System Timing and Data Formats

The LC75394NE receives its control sequences via a serial interface comprised of pins CE, CL, and DI. Each sequence consists of 40 bits: an 8-bit address followed by 32 bits of data.

## Usage Notes

1. When the power is first applied, the internal analog switches are in indeterminate states. The chip therefore requires muting or other external measures until it has received the proper data.
2. Provide grounding patterns or shielding for the lines to the CL, DI, and CE pins so as to prevent their high-frequency data signals from interfering with the operation of nearby analog circuits.
