

STK401-090

AF Power Amplifier (Split Power Supply)
(50 W + 50 W min, THD = 0.4%)

Overview

Now, thick-film audio power amplifier ICs are available with pin-compatibility to permit a single PCB to be designed and amplifier output capacity changed simply by installing a hybrid IC. This new series was developed with this kind of pin-compatibility to ensure integration between systems everywhere. With this new series of IC, even changes from 3-channel amplifier to 2-channel amplifiers is possible using the same PCB. In addition, this new series of ICs has a $6/3\Omega$ drive in order to support the low impedance of modern speakers.

Features

- Pin-compatible
STK400-000 series (3-channel/single package)
↓
STK401-000 series (2-channel/single package)
- Output load impedance $R_L=6\Omega/3\Omega$ supported
- New pin arrangement
To simplify input/output pattern layout and minimize the effects of pattern layout on operational characteristics, pin assignments are grouped into blocks consisting of input, output and power systems.
- Few external circuits
Compared to those series used until now, boot-strap capacitors and boot-strap resistors for external circuits can be greatly reduced.

Package Dimensions

unit: mm
4134

Specifications

Maximum Ratings at $T_a = 25^\circ\text{C}$

| Parameter | Symbol | Conditions | Ratings | Unit |
|---------------------------------------|---------------------|---|-----------------|--------------------|
| Maximum supply voltage | $V_{CC\text{ max}}$ | | ± 47 | V |
| Thermal resistance | θ_{j-c} | Per power transistor | 1.7 | $^\circ\text{C/W}$ |
| Junction temperature | T_j | | 150 | $^\circ\text{C}$ |
| Operating substrate temperature | T_c | | 125 | $^\circ\text{C}$ |
| Storage temperature range | T_{stg} | | -30 to $+125$ | $^\circ\text{C}$ |
| Available time for load short-circuit | t_s | $V_{CC} = \pm 32\text{ V}$, $R_L = 6\ \Omega$, $f = 50\text{ Hz}$, $P_O = 50\text{ W}$ | 1 | s |

Operating Characteristics at $T_a = 25^\circ\text{C}$, $R_L = 6\Omega$, $R_g = 600\Omega$, $V_G = 40\text{dB}$, R_L (non-inductive)

| Parameter | Symbol | Conditions | Ratings | | | Unit |
|---------------------------|-----------------|--|---------|------------|-----|------------|
| | | | min | typ | max | |
| Quiescent current | I_{CCO} | $V_{CC} = \pm 39\text{ V}$ | 20 | 60 | 100 | mA |
| Output power | $P_O(1)$ | $V_{CC} = \pm 32\text{ V}$, $f = 20\text{ Hz to } 20\text{ kHz}$, $\text{THD} = 0.4\%$ | 50 | 55 | | W |
| | $P_O(2)$ | $V_{CC} = \pm 26\text{ V}$, $f = 1\text{ kHz}$, $\text{THD} = 1.0\%$, $R_L = 3\Omega$ | 50 | 55 | | W |
| Total harmonic distortion | $\text{THD}(1)$ | $V_{CC} = \pm 32\text{ V}$, $f = 20\text{ Hz to } 20\text{ kHz}$, $P_O = 1.0\text{ W}$ | | | 0.4 | % |
| | $\text{THD}(2)$ | $V_{CC} = \pm 32\text{ V}$, $f = 1\text{ kHz}$, $P_O = 5.0\text{ W}$ | | 0.01 | | % |
| Frequency response | f_L, f_H | $V_{CC} = \pm 32\text{ V}$, $P_O = 1.0\text{ W}$, $+0_{-3}\text{ dB}$ | | 20 to 50 k | | Hz |
| Input impedance | r_i | $V_{CC} = \pm 32\text{ V}$, $f = 1\text{ kHz}$, $P_O = 1.0\text{ W}$ | | 55 | | k Ω |
| Output noise voltage | V_{NO} | $V_{CC} = \pm 39\text{ V}$, $R_g = 10\text{ k}\Omega$ | | | 1.2 | mVrms |
| Neutral voltage | V_N | $V_{CC} = \pm 39\text{ V}$ | -70 | 0 | +70 | mV |

Notes

- Use rated power supply for test unless otherwise specified.
- When measuring available time for load short-circuit and output noise voltage use transformer power supply indicated below.
- Output noise voltage is represented by the peak value rms (VTVM) for mean reading. Use an AC stabilized power supply (50 Hz) on the primary side to eliminate the effect of AC flicker noise.

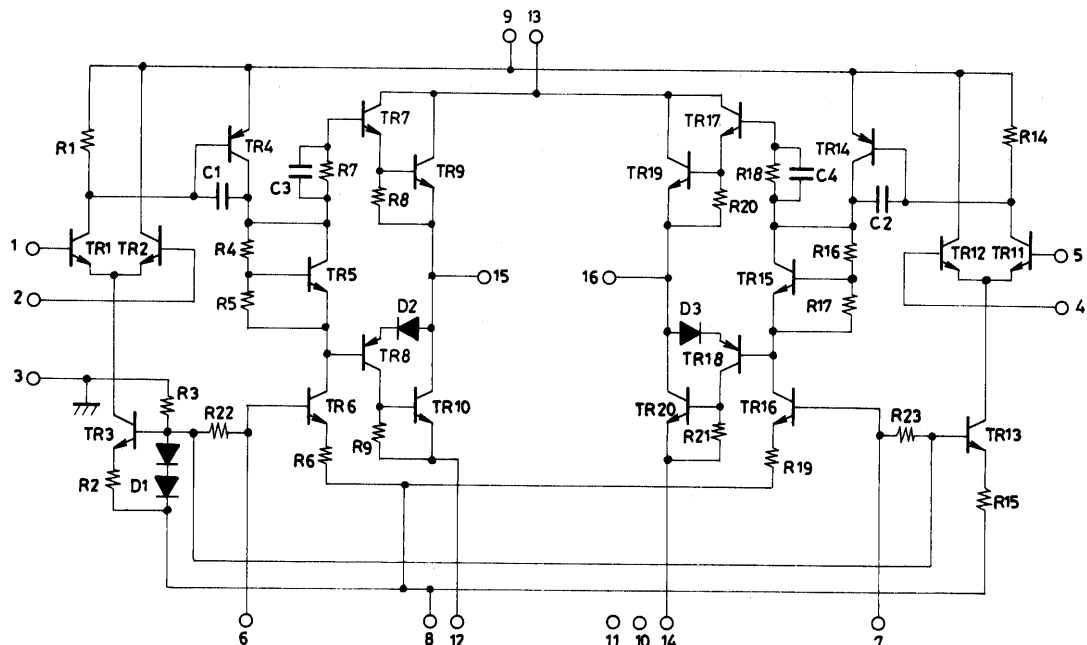

**Specified Transformer Power Supply
(MG-200 Equivalent)**

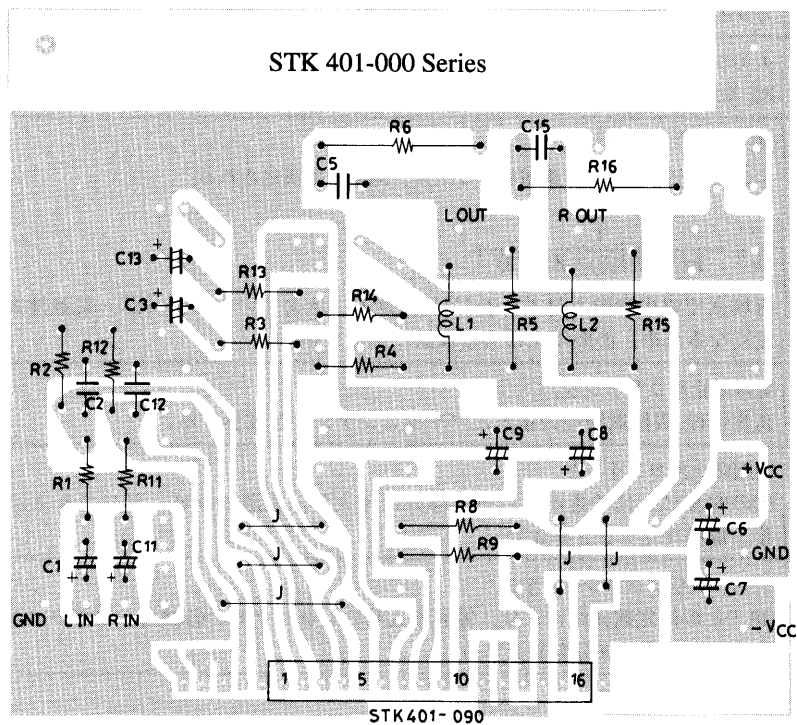

Unit (resistance: Ω , capacitance:F)

Unit (resistance: Ω , capacitance:F)

Internal Equivalent Circuit

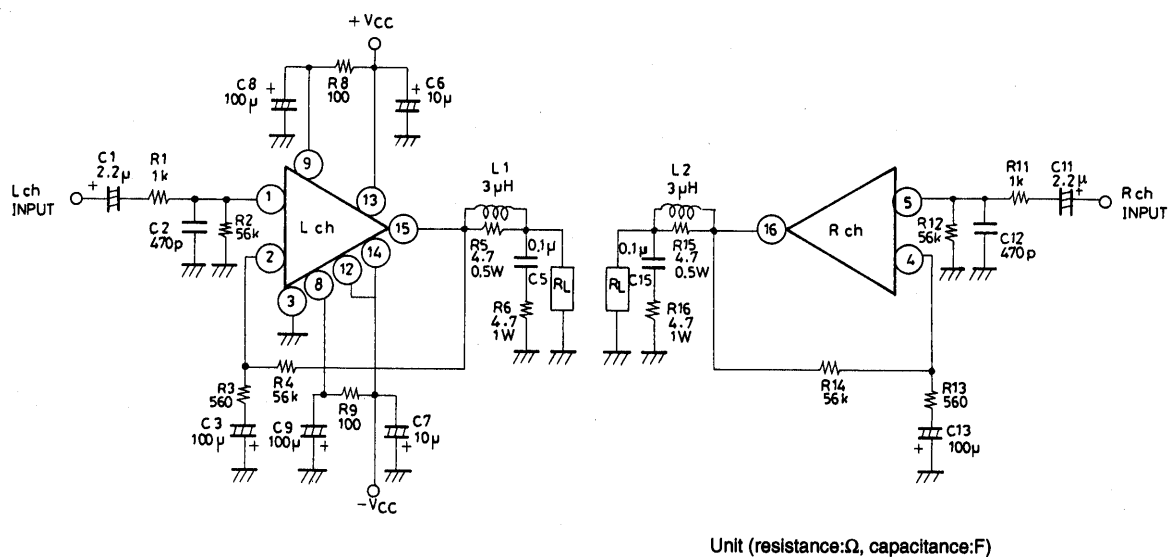

Pattern Example for PCB used with either 2- or 3-channel Amplifiers.

Copper (Cu) foil surface

With the STK401-000 series, the 6 pin corresponds to the 1 pin with respect to the STK400-000 series.

Sample Application Circuit

Description of External Circuits

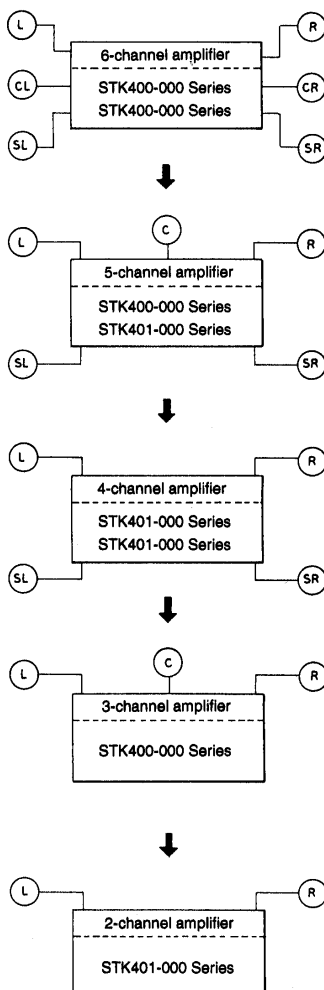

| | |
|---------------|--|
| C1, 11 | For input coupling capacitor. Used for DC current blocking. When capacitor reactance with low frequency is increased, the reactance value should be reduced in order to reduce the output noise from the signal resistance dependent 1/f noise. In response to the popping noise which occurs when the system power is turned on, C1 and C11 which determine the decay time constant on the input side are increased while C3 and C13 on the NF side are decreased. |
| C2, 12 | For input filter capacitor. Permits high-region noise reduction by utilizing filter constructed with R1 and R11. |
| C3, 13 | For NF capacitor. This capacitor determines the decline of the cut-off frequency and is calculated according to the following equation. $f_L = \frac{1}{2\pi \times C3 (13) \times R3 (13)}$ <p>For the purpose of achieving voltage gains prior to reduction, it is best that C3 and C13 are large. However, because the shock noise which occurs when the system power is turned on tends to increase, values larger than those absolutely necessary should be avoided.</p> |
| C5, 15 | For oscillation prevention capacitor. A Mylar capacitor with temperature and frequency features is recommended. |
| C6, 7 | For oscillation prevention capacitor. To ensure safe IC functioning, the capacitor should be installed as close as possible to the IC power pin to reduce power impedance. An electrolytic capacitor is good. |
| C8, 9 | For decoupling capacitor. Reduces shock noise during power up using decay time constant circuits with R8 and R9 and eliminates components such as ripples crossing over into the input side from the power line. |
| R1, 11 | For input filter applied resistor. |
| R2, 12 | For input bias resistor. The input pin is biased to zero potential. Input impedance is mostly decided with this resistance value. |
| R3, 13, 4, 14 | For resistors to determine voltage gain (VG). We recommend a VG = 40 dB using R3 and R13 = 560Ω and R4 and R14 = 56Ω. VG adjustments are best performed using R3 and R13. When using R4 and R14 for such purposes, R4 and R14 should be set to equal R2 and R12 in order to establish a stable V _N balance. |
| R5, 15 | For oscillation prevention resistor. |
| R6, 16 | For oscillation prevention resistor. This resistor's electrical output resides in the signal frequency and is calculated according to the following formula. $P_{R6 (16)} = \left(\frac{V_{CC \max}/\sqrt{2}}{1/2\pi f C5 (15) + R6 (16)} \right)^2 \times R6 (16)$ <p>f = output signal frequency upper limit</p> |
| R8, 9 | For ripple filter applied resistor. P _O max, ripple rejection and power-up shock noise are modified according to this value. Set the electrical output of these resistors while keeping in mind the flow of peak current during recharging to C8 and C9 which function as pre-drive TR control resistors during load shorts. |
| L1, 2 | For oscillation prevention coil. Compensates phase dislocation caused by load capacitors and ensures stable oscillation. |

Series Configuration

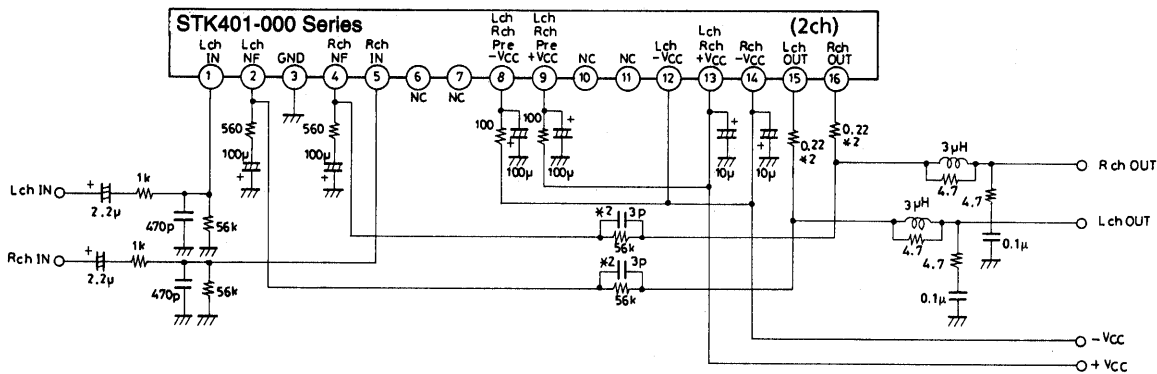

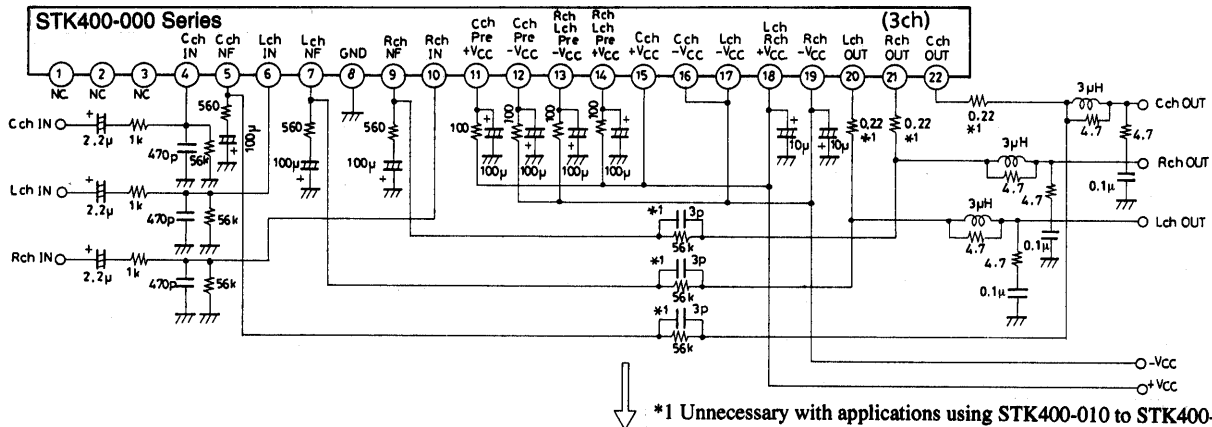

| 3ch Amp IC Name | Fixed Standard Output | 2ch Amp IC Name | Fixed Standard Output | THD [%] f = 20 to 20kHz | Supply voltage [V] | | | |

Unit (resistance:Ω, capacitance: F)

Heat Radiation Design Considerations

The radiator thermal resistance θ_{c-a} required for total substrate power dissipation P_d in the STK401-090 is determined as:

Condition 1: IC substrate temperature T_c not to exceed 125°C.

$$P_d \times \theta_{c-a} + T_a < 125^\circ\text{C} \quad (1)$$

where T_a is set assured ambient temperature.

Condition 2: Power transistor junction temperature T_j not to exceed 150°C.

$$P_d \times \theta_{c-a} + P_d/N \times \theta_{j-c} + T_a < 150^\circ\text{C} \quad (2)$$

where N is the number of power transistors and θ_{j-c} is the thermal resistance per power transistor chip. However, power transistor power consumption is P_d equally divided by N units.

Expressions (1) and (2) can be rewritten based on θ_{c-a} to yield:

$$\theta_{c-a} < (125 - T_a)/P_d \quad (1)'$$

$$\theta_{c-a} < (150 - T_a)/P_d - \theta_{j-c}/N \quad (2)'$$

The required radiator thermal resistance will satisfy both of these expressions.

From expressions (1)' and (2)', the required radiator thermal resistance can be determined once the following specifications are known:

- Supply voltage V_{CC}
- Load resistance R_L
- Assured ambient temperature T_a

The total substrate power consumption when STK401-090 V_{CC} is $\pm 32\text{ V}$ and R_L is $6\ \Omega$, for a continuous sine wave signal, is a maximum of 68.5W (Fig. 1). In general, when this sort of continuous signal is used for estimation of power consumption, the P_d used is 1/10th of P_o max (slight variation depending on safety standard).

$$P_d = 43\text{W} \quad (1/10\ P_o\ \text{max} = \text{during } 5\text{W})$$

The STK401-090 has four power transistors, so the thermal resistance per transistor θ_{j-c} is $1.7^{\circ}\text{C} / \text{W}$. With an assured ambient temperature T_a of 50°C , the required radiator thermal resistance θ_{c-a} would be:

$$\text{From expression (1)' } \theta_{c-a} < (125-50)/43 \\ < 1.74$$

$$\text{From expression (2)' } \theta_{c-a} < (150-50)/43 - 1.7/4 \\ < 1.90$$

To satisfy both, $1.74^{\circ}\text{C}/\text{W}$ is the required radiator thermal resistance.

Figure 2 illustrates $P_d - P_o$ when the V_{CC} of STK401-090 is $\pm 26\text{V}$ and R_L is functioning at 3Ω .

$$P_d = 51\text{W} \text{ (1/10 } P_o \text{ max = during 5W)}$$

$$\text{From expression (1)' } \theta_{c-a} < (125-50)/51 \\ < 1.47$$

$$\text{From expression (2)' } \theta_{c-a} < (150-50)/51 - 1.7/4 \\ < 1.53$$

To satisfy both, $1.47^{\circ}\text{C} / \text{W}$ is the required radiator thermal resistance. This design example is based on a fixed voltage supply, and will require verification within your specific set environment.
