11. Timing Chart

Read cycle timing chart - (\*10)

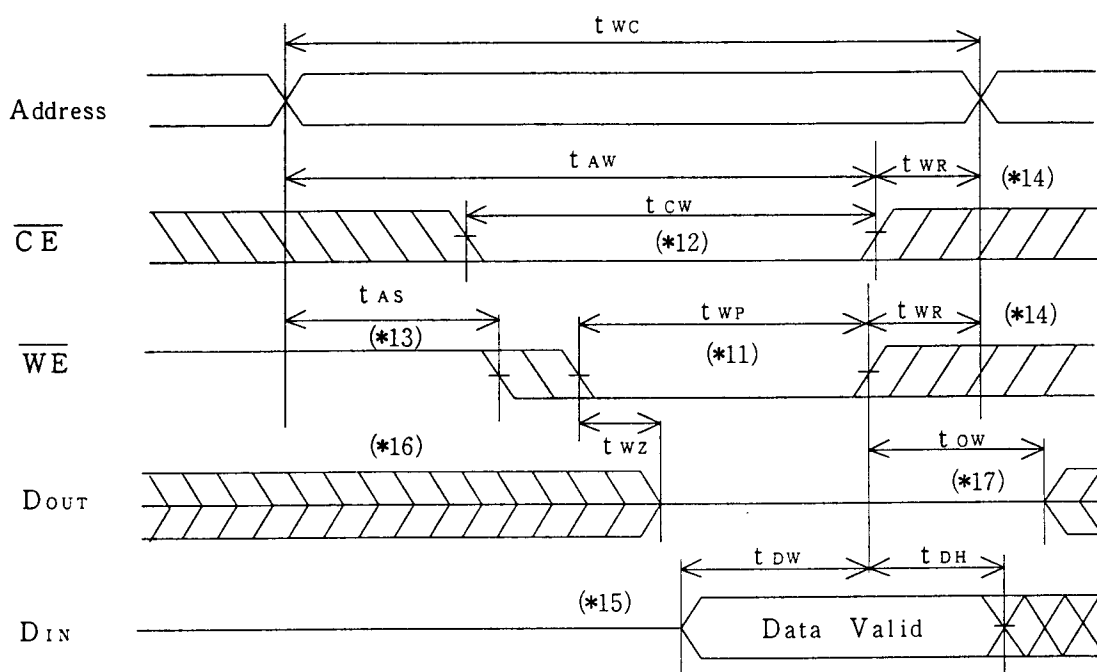

Note) \*10.  $\overline{WE}$  is high for Read cycle.

Write cycle timing chart - ( $\overline{OE}$  Controlled)

Write cycle timing chart— ( $\overline{OE}$  Low fixed)

Note) \* 11. A write occurs during the overlap of a low  $\overline{CE}$ , and a low  $\overline{WE}$ ,

A write begins at the latest transition among  $\overline{CE}$  going low, and  $\overline{WE}$  going low.

A write ends at the earliest transition among  $\overline{CE}$  going high, and  $\overline{WE}$  going high.

$t_{WP}$  is measured from the beginning of write to the end of write.

\* 12.  $t_{CW}$  is measured from the later of  $\overline{CE}$  going low to the end of write.

\* 13.  $t_{AS}$  is measured from the address valid to the beginning of write.

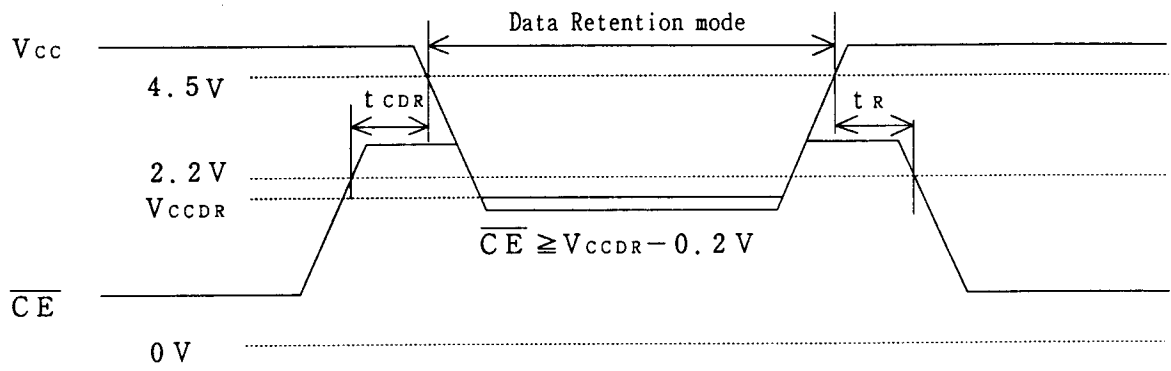

\* 14.  $t_{WR}$  is measured from the end of write to the address change.

\* 15. During this period, I/O pins are in the output state, therefore the input signals of opposite phase to the outputs must not be applied.

\* 16. If  $\overline{CE}$  goes low simultaneously with  $\overline{WE}$  going low or after  $\overline{WE}$  going low, the outputs remain in high impedance state.

\* 17. If  $\overline{CE}$  goes high simultaneously with  $\overline{WE}$  going high or before  $\overline{WE}$  going high, the outputs remain in high impedance state.
