

# M28W800BT M28W800BB

8 Mbit (512Kb x16, Boot Block)  
3V Supply Flash Memory

## FEATURES SUMMARY

- **SUPPLY VOLTAGE**
  - $V_{DD}$  = 2.7V to 3.6V Core Power Supply
  - $V_{DDQ}$  = 1.65V to 3.6V for Input/Output
  - $V_{PP}$  = 12V for fast Program (optional)
- **ACCESS TIME:** 70, 85, 90, 100ns
- **PROGRAMMING TIME**
  - 10 $\mu$ s typical
  - Double Word Programming Option
- **COMMON FLASH INTERFACE**
  - 64 bit Security Code
- **MEMORY BLOCKS**
  - Parameter Blocks (Top or Bottom location)
  - Main Blocks
- **BLOCK PROTECTION on TWO PARAMETER BLOCKS**
  - $\overline{WP}$  for Block Protection
- **AUTOMATIC STAND-BY MODE**
- **PROGRAM and ERASE SUSPEND**
- **100,000 PROGRAM/ERASE CYCLES per BLOCK**
- **ELECTRONIC SIGNATURE**
  - Manufacturer Code: 20h
  - Top Device Code, M28W800BT: 8892h
  - Bottom Device Code, M28W800BB: 8893h

## SUMMARY DESCRIPTION

The M28W800B is a 8 Mbit (512Kbit x 16) non-volatile Flash memory that can be erased electrically at the block level and programmed in-system on a Word-by-Word basis. These operations can be performed using a single low voltage (2.7 to 3.6V) supply.  $V_{DDQ}$  allows to drive the I/O pin down to 1.65V. An optional 12V  $V_{PP}$  power supply is provided to speed up customer programming.

The device features an asymmetrical blocked architecture. The M28W800B has an array of 23 blocks: 8 Parameter Blocks of 4 KWord and 15 Main Blocks of 32 KWord. M28W800BT has the Parameter Blocks at the top of the memory address space while the M28W800BB locates the Parameter Blocks starting from the bottom. The memory maps are shown in Figure 5, Block Addresses.

Parameter blocks 0 and 1 can be protected from accidental programming or erasure. Each block can be erased separately. Erase can be suspended in order to perform either read or program in any other block and then resumed. Program can be suspended to read data in any other block and then resumed. Each block can be programmed and erased over 100,000 cycles.

Program and Erase commands are written to the Command Interface of the memory. An on-chip Program/Erase Controller takes care of the timings necessary for program and erase operations. The end of a program or erase operation can be detected and any error conditions identified. The command set required to control the memory is consistent with JEDEC standards.

The memory is offered in TSOP48 (10 X 20mm), and TFBGA46 (6.39 x 6.37mm, 0.75mm pitch) packages and is supplied with all the bits erased (set to '1').

Note: Also see Appendix A, Tables 21 and 22 for a full listing of the Block Addresses.

## SIGNAL DESCRIPTIONS

See Figure 2 Logic Diagram and Table 1, Signal Names, for a brief overview of the signals connected to this device.

**Address Inputs (A0-A18).** The Address Inputs select the cells in the memory array to access during Bus Read operations. During Bus Write operations they control the commands sent to the Command Interface of the internal state machine.

**Data Input/Output (DQ0-DQ15).** The Data I/O outputs the data stored at the selected address during a Bus Read operation or inputs a command or data to be programmed during a Write Bus operation.

**Chip Enable ( $\overline{E}$ ).** The Chip Enable input activates the memory control logic, input buffers, decoders and sense amplifiers. When Chip Enable is at  $V_{IL}$  and Reset is at  $V_{IH}$  the device is in active mode. When Chip Enable is at  $V_{IH}$  the memory is deselected, the outputs are high impedance and the power consumption is reduced to the stand-by level.

**Output Enable ( $\overline{G}$ ).** The Output Enable controls data outputs during the Bus Read operation of the memory.

**Write Enable ( $\overline{W}$ ).** The Write Enable controls the Bus Write operation of the memory's Command Interface. The data and address inputs are latched on the rising edge of Chip Enable,  $\overline{E}$ , or Write Enable,  $\overline{W}$ , whichever occurs first.

**Write Protect (WP).** Write Protect is an input to protect or unprotect the two lockable parameter blocks. When Write Protect is at  $V_{IL}$ , the lockable blocks are protected and Program or Erase operations are not possible. When Write Protect is at  $V_{IH}$ , the lockable blocks are unprotected and can be programmed or erased (refer to Table 4, Memory Blocks Protection Truth).

**Reset (RP).** The Reset input provides a hardware reset of the memory. When Reset is at  $V_{IL}$ , the memory is in reset mode: the outputs are high impedance and the current consumption is mini-

mized. When Reset is at  $V_{IH}$ , the device is in normal operation. Exiting reset mode the device enters read array mode, but a negative transition of Chip Enable or a change of the address is required to ensure valid data outputs.

**$V_{DD}$  Supply Voltage.**  $V_{DD}$  provides the power supply to the internal core of the memory device. It is the main power supply for all operations (Read, Program and Erase).

**$V_{DDQ}$  Supply Voltage.**  $V_{DDQ}$  provides the power supply to the I/O pins and enables all Outputs to be powered independently from  $V_{DD}$ .  $V_{DDQ}$  can be tied to  $V_{DD}$  or can use a separate supply.

**$V_{PP}$  Program Supply Voltage.**  $V_{PP}$  is both a control input and a power supply pin. The two functions are selected by the voltage range applied to the pin. The Supply Voltage  $V_{DD}$  and the Program Supply Voltage  $V_{PP}$  can be applied in any order.

If  $V_{PP}$  is kept in a low voltage range (0V to 3.6V)  $V_{PP}$  is seen as a control input. In this case a voltage lower than  $V_{PPLK}$  gives an absolute protection against program or erase, while  $V_{PP} > V_{PP1}$  enables these functions (see Table 11, DC Characteristics for the relevant values).  $V_{PP}$  is only sampled at the beginning of a program or erase; a change in its value after the operation has started does not have any effect and program or erase operations continue.

If  $V_{PP}$  is in the range 11.4V to 12.6V it acts as a power supply pin. In this condition  $V_{PP}$  must be stable until the Program/Erase algorithm is completed (see Table 13 and 14).

**$V_{SS}$  Ground.**  $V_{SS}$  is the reference for all voltage measurements.

**Note:** Each device in a system should have  $V_{DD}$ ,  $V_{DDQ}$  and  $V_{PP}$  decoupled with a 0.1 $\mu$ F capacitor close to the pin. See Figure 7, AC Measurement Load Circuit. The PCB trace widths should be sufficient to carry the required  $V_{PP}$  Program and Erase currents.

## BUS OPERATIONS

There are six standard bus operations that control the device. These are Bus Read, Bus Write, Output Disable, Standby, Automatic Standby and Reset. See Table 2, Bus Operations, for a summary.

Typically glitches of less than 5ns on Chip Enable or Write Enable are ignored by the memory and do not affect bus operations.

**Read.** Read Bus operations are used to output the contents of the Memory Array, the Electronic Signature, the Status Register and the Common Flash Interface. Both Chip Enable and Output Enable must be at  $V_{IL}$  in order to perform a read operation. The Chip Enable input should be used to enable the device. Output Enable should be used to gate data onto the output. The data read depends on the previous command written to the memory (see Command Interface section). See Figure 8, Read Mode AC Waveforms, and Table 12, Read AC Characteristics, for details of when the output becomes valid.

Read mode is the default state of the device when exiting Reset or after power-up.

**Write.** Bus Write operations write Commands to the memory or latch Input Data to be programmed. A write operation is initiated when Chip Enable and Write Enable are at  $V_{IL}$  with Output Enable at  $V_{IH}$ . Commands, Input Data and Addresses are latched on the rising edge of Write Enable or Chip Enable, whichever occurs first.

See Figures 9 and 10, Write AC Waveforms, and Tables 13 and 14, Write AC Characteristics, for details of the timing requirements.

**Output Disable.** The data outputs are high impedance when the Output Enable is at  $V_{IH}$ .

**Standby.** Standby disables most of the internal circuitry allowing a substantial reduction of the current consumption. The memory is in stand-by when Chip Enable is at  $V_{IH}$  and the device is in read mode. The power consumption is reduced to the stand-by level and the outputs are set to high impedance, independently from the Output Enable or Write Enable inputs. If Chip Enable switches to  $V_{IH}$  during a program or erase operation, the device enters Standby mode when finished.

**Automatic Standby.** Automatic Standby provides a low power consumption state during Read mode. Following a read operation, the device enters Automatic Standby after 150ns of bus inactivity, even if Chip Enable is low,  $V_{IL}$ , and the supply current is reduced to  $I_{DD1}$ . The data Inputs/Outputs will still output data.

**Reset.** During Reset mode, when Output Enable is low,  $V_{IL}$ , the memory is deselected and the outputs are high impedance. The memory is in Reset mode when Reset is at  $V_{IL}$ . The power consumption is reduced to the Standby level, independently from the Chip Enable, Output Enable or Write Enable inputs. If Reset is pulled to  $V_{SS}$  during a Program or Erase, this operation is aborted and the memory content is no longer valid.

**Table 2. Bus Operations**

Operation	$\overline{E}$	$\overline{G}$	$\overline{W}$	$\overline{RP}$	$\overline{WP}$	$V_{PP}$	DQ0-DQ15
Read	$V_{IL}$	$V_{IL}$	$V_{IH}$	$V_{IH}$	X	Don't Care	Data Output
Write	$V_{IL}$	$V_{IH}$	$V_{IL}$	$V_{IH}$	X	$V_{DD}$ or $V_{PPH}$	Data Input
Output Disable	$V_{IL}$	$V_{IH}$	$V_{IH}$	$V_{IH}$	X	Don't Care	Hi-Z
Standby	$V_{IH}$	X	X	$V_{IH}$	X	Don't Care	Hi-Z
Reset	X	X	X	$V_{IL}$	X	Don't Care	Hi-Z

Note: X =  $V_{IL}$  or  $V_{IH}$ ,  $V_{PPH}$  = 12V  $\pm$  5%.

## COMMAND INTERFACE

All Bus Write operations to the memory are interpreted by the Command Interface. Commands consist of one or more sequential Bus Write operations. An internal Program/Erase Controller handles all timings and verifies the correct execution of the Program and Erase commands. The Program/Erase Controller provides a Status Register whose output may be read at any time, to monitor the progress of an operation, or the Program/Erase states. See Appendix D, Table 29, Write State Machine Current/Next, for a summary of the Command Interface.

The Command Interface is reset to Read mode when power is first applied, when exiting from Reset or whenever  $V_{DD}$  is lower than  $V_{LKO}$ . Command sequences must be followed exactly. Any invalid combination of commands will reset the device to Read mode. Refer to Table 3, Commands, in conjunction with the text descriptions below.

### Read Memory Array command

The Read command returns the memory to its Read mode. One Bus Write cycle is required to issue the Read Memory Array command and return the memory to Read mode. Subsequent read operations will read the addressed location and output the data. When a device Reset occurs, the memory defaults to Read mode.

### Read Status Register Command

The Status Register indicates when a program or erase operation is complete and the success or failure of the operation itself. Issue a Read Status Register command to read the Status Register's contents. Subsequent Bus Read operations read the Status Register, at any address, until another command is issued. See Table 7, Status Register Bits, for details on the definitions of the bits.

The Read Status Register command may be issued at any time, even during a Program/Erase operation. Any Read attempt during a Program/Erase operation will automatically output the content of the Status Register.

### Read Electronic Signature Command

The Read Electronic Signature command reads the Manufacturer and Device Codes.

The Read Electronic Signature command consists of one write cycle, a subsequent read will output the Manufacturer or the Device Code depending on the levels of A0. The Manufacturer Code is output when the address line A0 is at  $V_{IL}$ , the Device Code is output when A0 is at  $V_{IH}$ . Addresses A1-A7 must be kept to  $V_{IL}$ , other addresses are ignored. The codes are output on DQ0-DQ7 with DQ8-DQ15 at 00h. (see Table 4)

### Read CFI Query Command

The Read Query Command is used to read data from the Common Flash Interface (CFI) Memory Area, allowing programming equipment or applications to automatically match their interface to the characteristics of the device.

One Bus Write cycle is required to issue the Read Query Command. Once the command is issued subsequent Bus Read operations read from the Common Flash Interface Memory Area. See Appendix B, Common Flash Interface, Tables 23, 24, 25, 26, 27 and 28 for details on the information contained in the Common Flash Interface memory area.

### Block Erase Command

The Block Erase command can be used to erase a block. It sets all the bits within the selected block to '1'. All previous data in the block is lost. If the block is protected then the Erase operation will abort, the data in the block will not be changed and the Status Register will output the error.

Two Bus Write cycles are required to issue the command.

- The first bus cycle sets up the Erase command.
- The second latches the block address in the internal state machine and starts the Program/Erase Controller.

If the second bus cycle is not Write Erase Confirm (D0h), Status Register bits b4 and b5 are set and the command aborts.

Erase aborts if Reset turns to  $V_{IL}$ . As data integrity cannot be guaranteed when the Erase operation is aborted, the block must be erased again.

During Erase operations the memory will only accept the Read Status Register command and the Program/Erase Suspend command, all other commands will be ignored. Typical Erase times are given in Table 6, Program, Erase Times and Program/Erase Endurance Cycles.

See Appendix C, Figure 19, Erase Flowchart and Pseudo Code, for the flowchart for using the Erase command.

### Program Command

The memory array can be programmed word-by-word. Two bus write cycles are required to issue the Program command.

- The first bus cycle sets up the Program command.
- The second latches the Address and the Data to be written and starts the Program/Erase Controller.

During Program operations the memory will only accept the Read Status Register command and the Program/Erase Suspend command. All other

commands will be ignored. Typical Program times are given in Table 6, Program, Erase Times and Program/Erase Endurance Cycles.

Programming aborts if Reset goes to  $V_{IL}$ . As data integrity cannot be guaranteed when the program operation is aborted, the block containing the memory location must be erased and reprogrammed.

See Appendix C, Figure 16, Program Flowchart and Pseudo Code, for the flowchart for using the Program command.

#### **Double Word Program Command**

This feature is offered to improve the programming throughput, writing a page of two adjacent words in parallel. The two words must differ only for the address A0. Programming should not be attempted when  $V_{PP}$  is not at  $V_{PPH}$ . The command can be executed if  $V_{PP}$  is below  $V_{PPH}$  but the result is not guaranteed.

Three bus write cycles are necessary to issue the Double Word Program command.

- The first bus cycle sets up the Double Word Program command.
- The second bus cycle latches the Address and the Data of the first word to be written.
- The third bus cycle latches the Address and the Data of the second word to be written and starts the Program/Erase Controller.

Read operations output the Status Register content after the programming has started. Programming aborts if Reset goes to  $V_{IL}$ . As data integrity cannot be guaranteed when the program operation is aborted, the block containing the memory location must be erased and reprogrammed.

See Appendix C, Figure 17, Double Word Program Flowchart and Pseudo Code, for the flowchart for using the Double Word Program command.

#### **Clear Status Register Command**

The Clear Status Register command can be used to reset bits 1, 3, 4 and 5 in the Status Register to '0'. One bus write cycle is required to issue the Clear Status Register command.

The bits in the Status Register do not automatically return to '0' when a new Program or Erase command is issued. The error bits in the Status Register should be cleared before attempting a new Program or Erase command.

#### **Program/Erase Suspend Command**

The Program/Erase Suspend command is used to pause a Program or Erase operation. One bus write cycle is required to issue the Program/Erase command and pause the Program/Erase controller.

During Program/Erase Suspend the Command Interface will accept the Program/Erase Resume, Read Array, Read Status Register, Read Electronic Signature and Read CFI Query commands. Additionally, if the suspend operation was Erase then the Program command will also be accepted. Only the blocks not being erased may be read or programmed correctly.

During a Program/Erase Suspend, the device can be placed in a pseudo-standby mode by taking Chip Enable to  $V_{IH}$ . Program/Erase is aborted if Reset turns to  $V_{IL}$ .

See Appendix C, Figure 18, Program Suspend & Resume Flowchart and Pseudo Code, and Figure 20, Erase Suspend & Resume Flowchart and Pseudo Code for flowcharts for using the Program/Erase Suspend command.

#### **Program/Erase Resume Command**

The Program/Erase Resume command can be used to restart the Program/Erase Controller after a Program/Erase Suspend operation has paused it. One Bus Write cycle is required to issue the command. Once the command is issued subsequent Bus Read operations read the Status Register.

See Appendix C, Figure 18, Program or Double Word Program Suspend & Resume Flowchart and Pseudo Code, and Figure 20, Erase Suspend & Resume Flowchart and Pseudo Code for flowcharts for using the Program/Erase Resume command.

#### **Block Protection**

Two parameter/lockable blocks (blocks #0 and #1) can be protected against Program or Erase operations. Unprotected blocks can be programmed or erased.

To protect the two lockable blocks set Write Protect to  $V_{IL}$ . When  $V_{PP}$  is below  $V_{PPLK}$  all blocks are protected. Any attempt to Program or Erase protected blocks will abort, the data in the block will not be changed and the Status Register outputs the error.

Table 5, Memory Blocks Protection Truth Table, defines the protection methods.

Table 3. Commands

Commands	No. of Cycles	Bus Write Operations								
		1st Cycle			2nd Cycle			3rd Cycle		
		Bus Op.	Addr	Data	Bus Op.	Addr	Data	Bus Op.	Addr	Data
Read Memory Array	1+	Write	X	FFh	Read	Read Addr	Data			
Read Status Register	1+	Write	X	70h	Read	X	Status Register			
Read Electronic Signature	1+	Write	X	90h	Read	Signature Addr (2)	Signature			
Read CFI Query	1+	Write	X	98h	Read	CFI Addr	Query			
Erase	2	Write	X	20h	Write	Block Addr	D0h			
Program	2	Write	X	40h or 10h	Write	Addr	Data Input			
Double Word Program <sup>(3)</sup>	3	Write	X	30h	Write	Addr 1	Data Input	Write	Addr 2	Data Input
Clear Status Register	1	Write	X	50h						
Program/Erase Suspend	1	Write	X	B0h						
Program/Erase Resume	1	Write	X	D0h						

Note: 1. X = Don't Care.

2. A0=V<sub>IL</sub> outputs Manufacturer code, A0=V<sub>IH</sub> outputs Device code. Address A7-A1 must be V<sub>IL</sub>.

3. Addr 1 and Addr 2 must be consecutive Addresses differing only for A0.

Table 4. Read Electronic Signature

Code	Device	$\overline{E}$	$\overline{G}$	$\overline{W}$	A0	A1-A7	A8-A18	DQ0-DQ7	DQ8-DQ15
Manufact. Code		V <sub>IL</sub>	V <sub>IL</sub>	V <sub>IH</sub>	V <sub>IL</sub>	V <sub>IL</sub>	Don't Care	20h	00h
Device Code	M28W800BT	V <sub>IL</sub>	V <sub>IL</sub>	V <sub>IH</sub>	V <sub>IH</sub>	V <sub>IL</sub>	Don't Care	92h	88h
	M28W800BB	V <sub>IL</sub>	V <sub>IL</sub>	V <sub>IH</sub>	V <sub>IH</sub>	V <sub>IL</sub>	Don't Care	93h	88h

Note:  $\overline{RP}$  = V<sub>IH</sub>.

Table 5. Memory Blocks Protection Truth Table

V <sub>PP</sub> <sup>(1)</sup>	$\overline{RP}$	$\overline{WP}$ <sup>(1)</sup>	Lockable Blocks (blocks #0 and #1)	Other Blocks
X	V <sub>IL</sub>	X	Protected	Protected
V <sub>IL</sub>	V <sub>IH</sub>	X	Protected	Protected
V <sub>DD</sub> or V <sub>PPH</sub> <sup>(2)</sup>	V <sub>IH</sub>	V <sub>IL</sub>	Protected	Unprotected
V <sub>DD</sub> or V <sub>PPH</sub> <sup>(2)</sup>	V <sub>IH</sub>	V <sub>IH</sub>	Unprotected	Unprotected

Note: 1. X = Don't Care

2. V<sub>PP</sub> must also be greater than the Program Voltage Lock Out V<sub>PPLK</sub>.

**Table 6. Program, Erase Times and Program/Erase Endurance Cycles**

Parameter	Test Conditions	M28W800B			Unit
		Min	Typ	Max	
Word Program	$V_{PP} = V_{DD}$		10	200	$\mu s$
Double Word Program	$V_{PP} = 12V \pm 5\%$		10	200	$\mu s$
Main Block Program	$V_{PP} = 12V \pm 5\%$		0.16	5	s
	$V_{PP} = V_{DD}$		0.32	5	s
Parameter Block Program	$V_{PP} = 12V \pm 5\%$		0.02	4	s
	$V_{PP} = V_{DD}$		0.04	4	s
Main Block Erase	$V_{PP} = 12V \pm 5\%$		1	10	s
	$V_{PP} = V_{DD}$		1	10	s
Parameter Block Erase	$V_{PP} = 12V \pm 5\%$		0.8	10	s
	$V_{PP} = V_{DD}$		0.8	10	s
Program/Erase Cycles (per Block)		100,000			cycles

## STATUS REGISTER

The Status Register provides information on the current or previous Program or Erase operation. The various bits convey information and errors on the operation. To read the Status register the Read Status Register command can be issued, refer to the Read Status Register Command section. To output the contents, the Status Register is latched on the falling edge of the Chip Enable or Output Enable signals, and can be read until Chip Enable or Output Enable returns to  $V_{IH}$ . Either Chip Enable or Output Enable must be toggled to update the latched data.

Bus Read operations from any address always read the Status Register during Program and Erase operations.

The bits in the Status Register are summarized in Table 7, Status Register Bits. Refer to Table 7 in conjunction with the following text descriptions.

**Program/Erase Controller Status (Bit 7).** The Program/Erase Controller Status bit indicates whether the Program/Erase Controller is active or inactive. When the Program/Erase Controller Status bit is Low (set to '0'), the Program/Erase Controller is active; when the bit is High (set to '1'), the Program/Erase Controller is inactive, and the device is ready to process a new command.

The Program/Erase Controller Status is Low immediately after a Program/Erase Suspend command is issued until the Program/Erase Controller pauses. After the Program/Erase Controller pauses the bit is High.

During Program, Erase, operations the Program/Erase Controller Status bit can be polled to find the end of the operation. Other bits in the Status Register should not be tested until the Program/Erase Controller completes the operation and the bit is High.

After the Program/Erase Controller completes its operation the Erase Status, Program Status,  $V_{PP}$  Status and Block Protection Status bits should be tested for errors.

**Erase Suspend Status (Bit 6).** The Erase Suspend Status bit (set to '1') indicates that an Erase operation has been suspended or is going to be suspended.

The Erase Suspend Status should only be considered valid when the Program/Erase Controller Status bit is High (Program/Erase Controller inactive). Bit 7 is set within 30 $\mu$ s of the Program/Erase Suspend command being issued therefore the memory may still complete the operation rather than entering the Suspend mode.

When a Program/Erase Resume command is issued the Erase Suspend Status bit returns Low.

**Erase Status (Bit 5).** The Erase Status bit can be used to identify if the memory has failed to verify that the block has erased correctly. When the Erase Status bit is High (set to '1'), the Program/Erase Controller has applied the maximum number of pulses to the block and still failed to verify that the block has erased correctly. The Erase Status bit should be read once the Program/Erase Controller Status bit is High (Program/Erase Controller inactive).

Once set High, the Erase Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set High it should be reset before a new Program or Erase command is issued, otherwise the new command will appear to fail.

**Program Status (Bit 4).** The Program Status bit is used to identify a Program failure. When the Program Status bit is High (set to '1'), the Program/Erase Controller has applied the maximum number of pulses to the byte and still failed to verify that it has programmed correctly. The Program Status bit should be read once the Program/Erase Controller Status bit is High (Program/Erase Controller inactive).

Once set High, the Program Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set High it should be reset before a new command is issued, otherwise the new command will appear to fail.

**$V_{PP}$  Status (Bit 3).** The  $V_{PP}$  Status bit can be used to identify an invalid voltage on the  $V_{PP}$  pin during Program and Erase operations. The  $V_{PP}$  pin is only sampled at the beginning of a Program or Erase operation. Indeterminate results can occur if  $V_{PP}$  becomes invalid during an operation.

When the  $V_{PP}$  Status bit is Low (set to '0'), the voltage on the  $V_{PP}$  pin was sampled at a valid voltage; when the  $V_{PP}$  Status bit is High (set to '1'), the  $V_{PP}$  pin has a voltage that is below the  $V_{PP}$  Lockout Voltage,  $V_{PPLK}$ , the memory is protected and Program and Erase operations cannot be performed.

Once set High, the  $V_{PP}$  Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set High it should be reset before a new Program or Erase command is issued, otherwise the new command will appear to fail.

**Program Suspend Status (Bit 2).** The Program Suspend Status bit (set to '1') indicates that a Program operation has been suspended or is going to be suspended.

The Program Suspend Status should only be considered valid when the Program/Erase Controller Status bit is High (Program/Erase Controller inactive). Bit 2 is set within 5 $\mu$ s of the Program/Erase Suspend command being issued therefore the

memory may still complete the operation rather than entering the Suspend mode. When a Program/Erase Resume command is issued the Program Suspend Status bit returns Low.

**Block Protection Status (Bit 1).** The Block Protection Status bit can be used to identify if a Program or Erase operation has tried to modify the contents of a protected block.

When the Block Protection Status bit is High (set to '1'), a Program or Erase operation has been attempted on a protected block.

Once set High, the Block Protection Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set High it should be reset before a new command is issued, otherwise the new command will appear to fail.

**Reserved (Bit 0).** Bit 0 of the Status Register is reserved. Its value must be masked.

**Note: Refer to Appendix C, Flowcharts and Pseudo Codes, for using the Status Register.**

**Table 7. Status Register Bits**

Bit	Name	Logic Level	Definition
7	P/E.C. Status	'1'	Ready
		'0'	Busy
6	Erase Suspend Status	'1'	Suspended
		'0'	In progress or Completed
5	Erase Status	'1'	Erase Error
		'0'	Erase Success
4	Program Status	'1'	Program Error
		'0'	Program Success
3	V <sub>PP</sub> Status	'1'	V <sub>PP</sub> Invalid, Abort
		'0'	V <sub>PP</sub> OK
2	Program Suspend Status	'1'	Suspended
		'0'	In Progress or Completed
1	Block Protection Status	'1'	Program/Erase on protected Block, Abort
		'0'	No operation to protected blocks
0	Reserved		

Note: Logic level '1' is High, '0' is Low.

**MAXIMUM RATING**

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. These are stress ratings only and operation of the device at

these or any other conditions above those indicated in the Operating sections of this specification is not implied. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 8. Absolute Maximum Ratings**

Symbol	Parameter	Value		Unit
		Min	Max	
T <sub>A</sub>	Ambient Operating Temperature <sup>(1)</sup>	–40	85	°C
T <sub>BIAS</sub>	Temperature Under Bias	–40	125	°C
T <sub>STG</sub>	Storage Temperature	–55	155	°C
V <sub>IO</sub>	Input or Output Voltage	–0.6	V <sub>DDQ</sub> +0.6	V
V <sub>DD</sub> , V <sub>DDQ</sub>	Supply Voltage	–0.6	4.1	V
V <sub>PP</sub>	Program Voltage	–0.6	13	V

Note: 1. Depends on range.

**DC AND AC PARAMETERS**

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics Tables that follow, are derived from tests performed under the Measure-

ment Conditions summarized in Table 9, Operating and AC Measurement Conditions. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

**Table 9. Operating and AC Measurement Conditions**

Parameter	M28W800BT, M28W800BB								
	70		85		90		100		Units
	Min	Max	Min	Max	Min	Max	Min	Max	
V <sub>DD</sub> Supply Voltage	2.7	3.6	2.7	3.6	2.7	3.6	2.7	3.6	V
V <sub>DDQ</sub> Supply Voltage (V <sub>DDQ</sub> ≤ V <sub>DD</sub> )	2.7	3.6	2.7	3.6	2.7	3.6	1.65	3.6	V
Ambient Operating Temperature	−40	85	−40	85	−40	85	−40	85	°C
Load Capacitance (C <sub>L</sub> )	50		50		50		50		pF
Input Rise and Fall Times		5		5		5		5	ns
Input Pulse Voltages	0 to V <sub>DDQ</sub>		0 to V <sub>DDQ</sub>		0 to V <sub>DDQ</sub>		0 to V <sub>DDQ</sub>		V
Input and Output Timing Ref. Voltages	V <sub>DDQ</sub> /2		V <sub>DDQ</sub> /2		V <sub>DDQ</sub> /2		V <sub>DDQ</sub> /2		V

**Figure 6. AC Measurement I/O Waveform**

**Figure 7. AC Measurement Load Circuit**

**Table 10. Device Capacitance**

Symbol	Parameter	Test Condition	Min	Max	Unit
C <sub>IN</sub>	Input Capacitance	V <sub>IN</sub> = 0V		6	pF
C <sub>OUT</sub>	Output Capacitance	V <sub>OUT</sub> = 0V		12	pF

Note: Sampled only, not 100% tested.

Table 11. DC Characteristics

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
$I_{LI}$	Input Leakage Current	$0V \leq V_{IN} \leq V_{DDQ}$			$\pm 1$	$\mu A$
$I_{LO}$	Output Leakage Current	$0V \leq V_{OUT} \leq V_{DDQ}$			$\pm 10$	$\mu A$
$I_{DD}$	Supply Current (Read)	$\overline{E} = V_{SS}, \overline{G} = V_{IH}, f = 5MHz$		10	20	mA
$I_{DD1}$	Supply Current (Stand-by or Automatic Stand-by)	$\overline{E} = V_{DDQ} \pm 0.2V$ , $\overline{RP} = V_{DDQ} \pm 0.2V$		15	50	$\mu A$
$I_{DD2}$	Supply Current (Reset)	$\overline{RP} = V_{SS} \pm 0.2V$		15	50	$\mu A$
$I_{DD3}$	Supply Current (Program)	Program in progress $V_{PP} = 12V \pm 5\%$		10	20	mA
		Program in progress $V_{PP} = V_{DD}$		10	20	mA
$I_{DD4}$	Supply Current (Erase)	Erase in progress $V_{PP} = 12V \pm 5\%$		5	20	mA
		Erase in progress $V_{PP} = V_{DD}$		5	20	mA
$I_{DD5}$	Supply Current (Program/Erase Suspend)	$\overline{E} = V_{DDQ} \pm 0.2V$ , Erase suspended			50	$\mu A$
$I_{PP}$	Program Current (Read or Stand-by)	$V_{PP} > V_{DD}$			400	$\mu A$
$I_{PP1}$	Program Current (Read or Stand-by)	$V_{PP} \leq V_{DD}$			5	$\mu A$
$I_{PP2}$	Program Current (Reset)	$\overline{RP} = V_{SS} \pm 0.2V$			5	$\mu A$
$I_{PP3}$	Program Current (Program)	Program in progress $V_{PP} = 12V \pm 5\%$			10	mA
		Program in progress $V_{PP} = V_{DD}$			5	$\mu A$
$I_{PP4}$	Program Current (Erase)	Erase in progress $V_{PP} = 12V \pm 5\%$			10	mA
		Erase in progress $V_{PP} = V_{DD}$			5	$\mu A$
$V_{IL}$	Input Low Voltage		-0.5		0.4	V
		$V_{DDQ} \geq 2.7V$	-0.5		0.8	V
$V_{IH}$	Input High Voltage		$V_{DDQ} - 0.4$		$V_{DDQ} + 0.4$	V
		$V_{DDQ} \geq 2.7V$	$0.7 V_{DDQ}$		$V_{DDQ} + 0.4$	V
$V_{OL}$	Output Low Voltage	$I_{OL} = 100\mu A$ , $V_{DD} = V_{DD} \text{ min}$ , $V_{DDQ} = V_{DDQ} \text{ min}$			0.1	V
$V_{OH}$	Output High Voltage	$I_{OH} = -100\mu A$ , $V_{DD} = V_{DD} \text{ min}$ , $V_{DDQ} = V_{DDQ} \text{ min}$	$V_{DDQ} - 0.1$			V
$V_{PP1}$	Program Voltage (Program or Erase operations)		1.65		3.6	V
$V_{PPH}$	Program Voltage (Program or Erase operations)		11.4		12.6	V
$V_{PPLK}$	Program Voltage (Program and Erase lock-out)				1	V
$V_{LKO}$	$V_{DD}$ Supply Voltage (Program and Erase lock-out)				2	V

**APPENDIX B. COMMON FLASH INTERFACE (CFI)**

The Common Flash Interface is a JEDEC approved, standardized data structure that can be read from the Flash memory device. It allows a system software to query the device to determine various electrical and timing parameters, density information and functions supported by the memory. The system can interface easily with the device, enabling the software to upgrade itself when necessary.

When the CFI Query Command (RCFI) is issued the device enters CFI Query mode and the data

structure is read from the memory. Tables 23, 24, 25, 26, 27 and 28 show the addresses used to retrieve the data.

The CFI data structure also contains a security area where a 64 bit unique security number is written (see Table 28, Security Code area). This area can be accessed only in Read mode by the final user. It is impossible to change the security number after it has been written by ST. Issue a Read command to return to Read mode.

**Table 23. Query Structure Overview**

Offset	Sub-section Name	Description
00h	Reserved	Reserved for algorithm-specific information
10h	CFI Query Identification String	Command set ID and algorithm data offset
1Bh	System Interface Information	Device timing & voltage information
27h	Device Geometry Definition	Flash device layout
P	Primary Algorithm-specific Extended Query table	Additional information specific to the Primary Algorithm (optional)
A	Alternate Algorithm-specific Extended Query table	Additional information specific to the Alternate Algorithm (optional)

Note: Query data are always presented on the lowest order data outputs.

**Table 24. CFI Query Identification String**

Offset	Data	Description	Value
00h	0020h	Manufacturer Code	ST
01h	8892h 8893h	Device Code	Top Bottom
02h-0Fh	reserved	Reserved	
10h	0051h	Query Unique ASCII String "QRY"	"Q"
11h	0052h	Query Unique ASCII String "QRY"	"R"
12h	0059h	Query Unique ASCII String "QRY"	"Y"
13h 14h	0003h 0000h	Primary Algorithm Command Set and Control Interface ID code 16 bit ID code defining a specific algorithm	Intel Compatible
15h 16h	offset = P = 0035h 0000h	Address for Primary Algorithm extended Query table	P=35h
17h 18h	0000h 0000h	Alternate Vendor Command Set and Control Interface ID Code second vendor - specified algorithm supported (note: 0000h means none exists)	NA
19h 1Ah	value = A = 0000h 0000h	Address for Alternate Algorithm extended Query table note: 0000h means none exists	NA

Note: Query data are always presented on the lowest order data outputs (DQ7-DQ0) only. DQ8-DQ15 are '0'.

Table 25. CFI Query System Interface Information

Offset	Data	Description	Value
1Bh	0027h	V <sub>DD</sub> Logic Supply Minimum Program/Erase or Write voltage bit 7 to 4 BCD value in volts bit 3 to 0 BCD value in 100 mV	2.7V
1Ch	0036h	V <sub>DD</sub> Logic Supply Maximum Program/Erase or Write voltage bit 7 to 4 BCD value in volts bit 3 to 0 BCD value in 100 mV	3.6V
1Dh	00B4h	V <sub>PP</sub> [Programming] Supply Minimum Program/Erase voltage bit 7 to 4 HEX value in volts bit 3 to 0 BCD value in 100 mV	11.4V
1Eh	00C6h	V <sub>PP</sub> [Programming] Supply Maximum Program/Erase voltage bit 7 to 4 HEX value in volts bit 3 to 0 BCD value in 100 mV	12.6V
1Fh	0004h	Typical timeout per single word program = 2 <sup>n</sup> μs	16μs
20h	0004h	Typical timeout for Double Word Program = 2 <sup>n</sup> μs	16μs
21h	000Ah	Typical timeout per individual block erase = 2 <sup>n</sup> ms	1 s
22h	0000h	Typical timeout for full chip erase = 2 <sup>n</sup> ms	NA
23h	0005h	Maximum timeout for word program = 2 <sup>n</sup> times typical	512μs
24h	0005h	Maximum timeout for Double Word Program = 2 <sup>n</sup> times typical	512μs
25h	0003h	Maximum timeout per individual block erase = 2 <sup>n</sup> times typical	8 s
26h	0000h	Maximum timeout for chip erase = 2 <sup>n</sup> times typical	NA

**Table 26. Device Geometry Definition**

Offset Word Mode		Data	Description	Value
27h		0014h	Device Size = $2^n$ in number of bytes	1MByte
28h 29h		0001h 0000h	Flash Device Interface Code description	x16 Async
2Ah 2Bh		0002h 0000h	Maximum number of bytes in multi-byte program or page = $2^n$	4
2Ch		0002h	Number of Erase Block Regions within the device. It specifies the number of regions within the device containing contiguous Erase Blocks of the same size.	2
M28W800BT	2Dh 2Eh	000Eh 0000h	Region 1 Information Number of identical-size erase block = $000Eh+1$	15
	2Fh 30h	0000h 0001h	Region 1 Information Block size in Region 1 = $0100h * 256$ byte	64KByte
	31h 32h	0007h 0000h	Region 2 Information Number of identical-size erase block = $0007h+1$	8
	33h 34h	0020h 0000h	Region 2 Information Block size in Region 2 = $0020h * 256$ byte	8KByte
M28W800BB	2Dh 2Eh	0007h 0000h	Region 1 Information Number of identical-size erase block = $0007h+1$	8
	2Fh 30h	0020h 0000h	Region 1 Information Block size in Region 1 = $0020h * 256$ byte	8KByte
	31h 32h	000Eh 0000h	Region 2 Information Number of identical-size erase block = $000Eh+1$	15
	33h 34h	0000h 0001h	Region 2 Information Block size in Region 2 = $0100h * 256$ byte	64KByte

Table 27. Primary Algorithm-Specific Extended Query Table

Offset P = 35h <sup>(1)</sup>	Data	Description	Value
(P+0)h = 35h	0050h	Primary Algorithm extended Query table unique ASCII string "PRI"	"P"
(P+1)h = 36h	0052h		"R"
(P+2)h = 37h	0049h		"I"
(P+3)h = 38h	0031h	Major version number, ASCII	"1"
(P+4)h = 39h	0030h	Minor version number, ASCII	"0"
(P+5)h = 3Ah	0006h	Extended Query table contents for Primary Algorithm. Address (P+5)h contains less significant byte.  bit 0      Chip Erase supported                      (1 = Yes, 0 = No) bit 1      Erase Suspend supported                    (1 = Yes, 0 = No) bit 2      Program Suspend                              (1 = Yes, 0 = No) bit 3      Lock/Unlock supported                        (1 = Yes, 0 = No) bit 4      Queued Erase supported                      (1 = Yes, 0 = No) bit 31 to 5   Reserved; undefined bits are '0'	No
(P+6)h = 3Bh	0000h		Yes
(P+7)h = 3Ch	0000h		Yes
(P+8)h = 3Dh	0000h		No
			No
			No
(P+9)h = 3Eh	0001h	Supported Functions after Suspend Read Array, Read Status Register and CFI Query are always supported during Erase or Program operation  bit 0      Program supported after Erase Suspend (1 = Yes, 0 = No) bit 7 to 1   Reserved; undefined bits are '0'	Yes
(P+A)h = 3Fh	0000h	Block Lock Status Defines which bits in the Block Status Register section of the Query are implemented.  bit 0      Block Lock Status Register Lock/Unlock bit active (1 = Yes, 0 = No) bit 1      Block Lock Status Register Lock-Down bit active (1 = Yes, 0 = No) bit 15 to 2   Reserved for future use; undefined bits are '0'	NA
(P+B)h = 40h	0000h		
(P+C)h = 41h	0030h	V <sub>DD</sub> Logic Supply Optimum Program/Erase voltage (highest performance)  bit 7 to 4    HEX value in volts bit 3 to 0    BCD value in 100 mV	3V
(P+D)h = 42h	00C0h	V <sub>PP</sub> Supply Optimum Program/Erase voltage  bit 7 to 4    HEX value in volts bit 3 to 0    BCD value in 100 mV	12V
(P+E)h	0000h	Reserved	

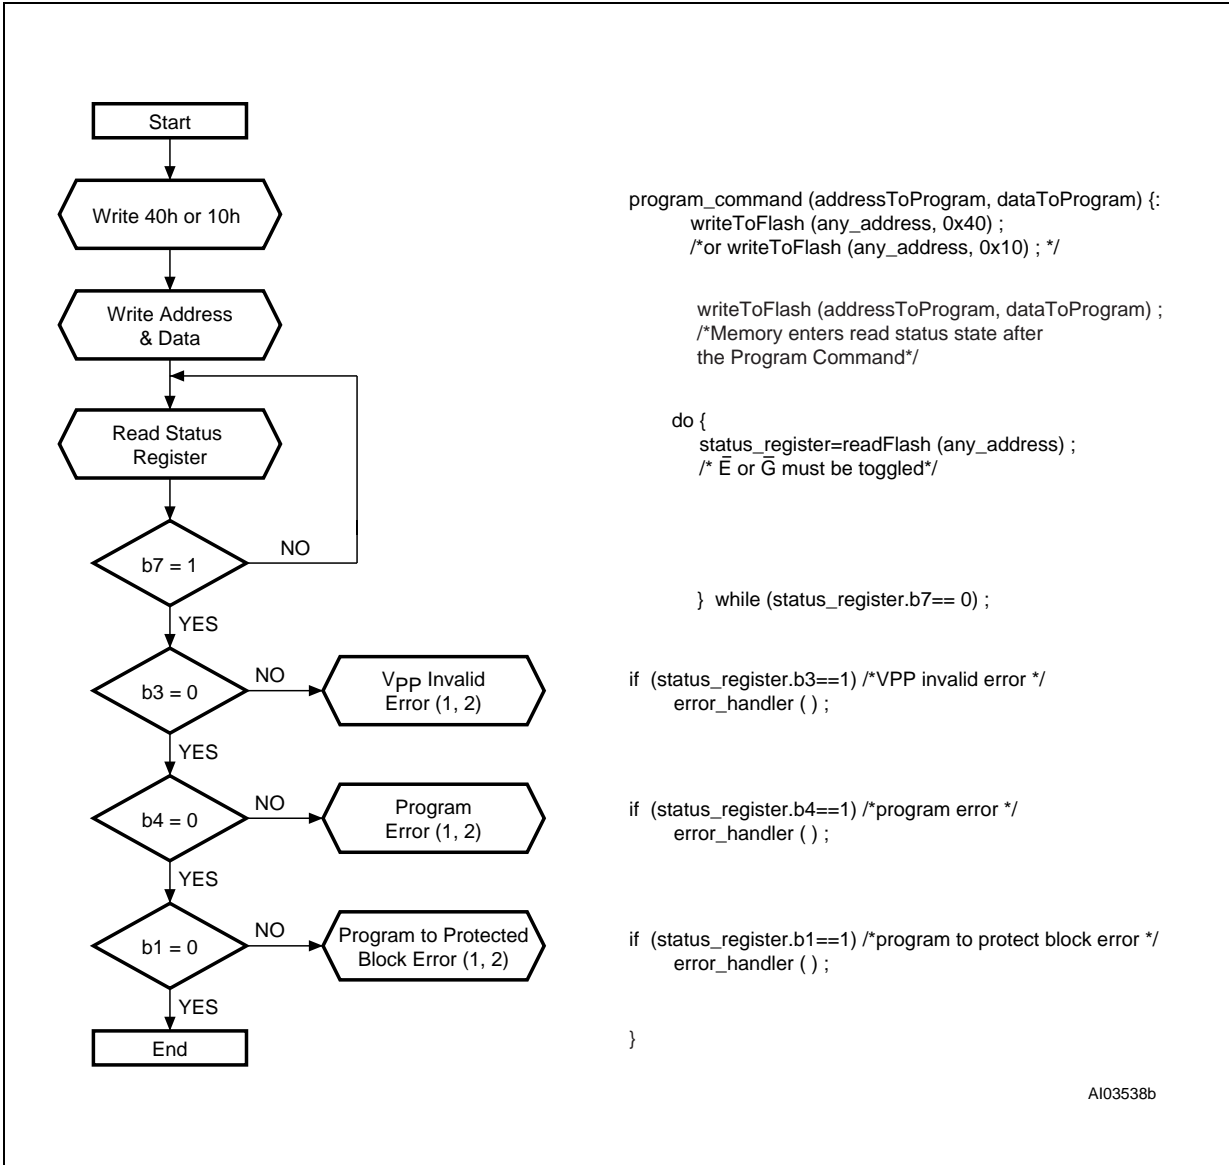

Note: 1. See Table 24, offset 15h for P pointer definition.

Table 28. Security Code Area

Offset	Data	Description
81h	XXXX	64 bits unique device number.
82h	XXXX	
83h	XXXX	
84h	XXXX	

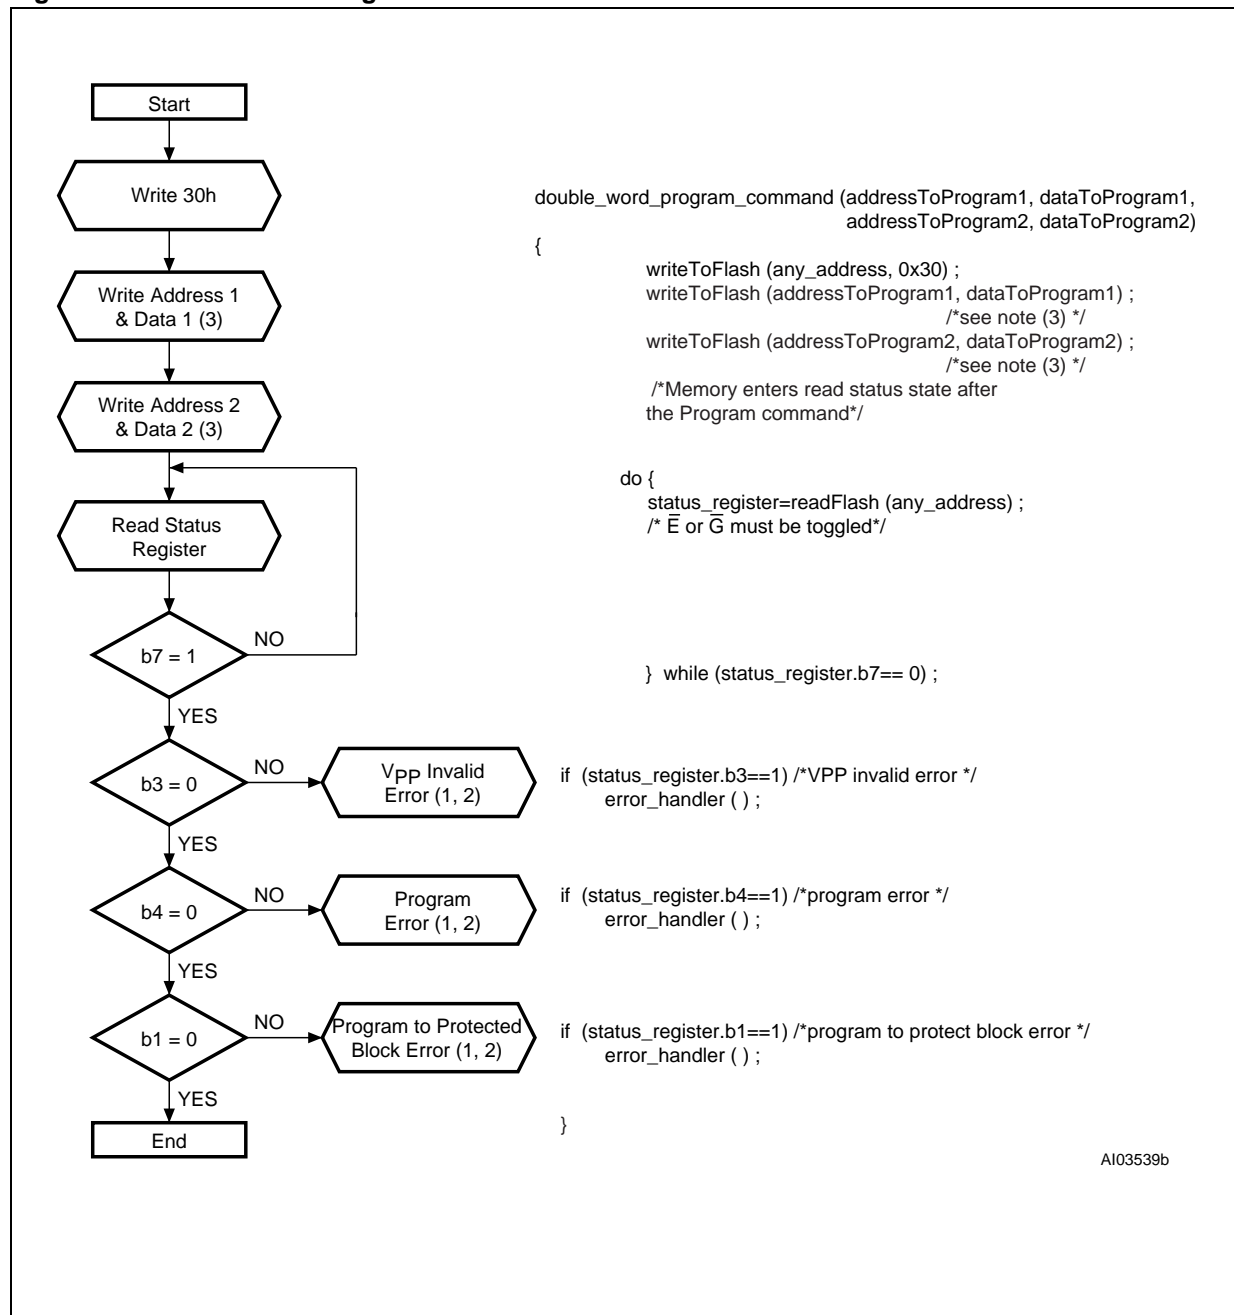

APPENDIX C. FLOWCHARTS AND PSEUDO CODES

Figure 16. Program Flowchart and Pseudo Code

Note: 1. Status check of b1 (Protected Block), b3 (Vpp Invalid) and b4 (Program Error) can be made after each program operation or after a sequence.  
2. If an error is found, the Status Register must be cleared before further Program/Erase Controller operations.

Figure 17. Double Word Program Flowchart and Pseudo Code

Note: 1. Status check of b1 (Protected Block), b3 (Vpp Invalid) and b4 (Program Error) can be made after each program operation or after a sequence.

2. If an error is found, the Status Register must be cleared before further Program/Erase operations.

3. Address 1 and Address 2 must be consecutive addresses differing only for bit A0.

Figure 18. Program Suspend &amp; Resume Flowchart and Pseudo Code

```

program_suspend_command ( ) {
    writeToFlash (any_address, 0xB0) ;

```

```

    writeToFlash (any_address, 0x70) ;
    /* read status register to check if
    program has already completed */

```

```

do {
    status_register=readFlash (any_address) ;
    /* E or G must be toggled*/

```

```

} while (status_register.b7== 0) ;

```

```

if (status_register.b2==0) /*program completed */
{
    writeToFlash (any_address, 0xFF) ;
