

# M36W432T M36W432B

## 32 Mbit (2Mb x16, Boot Block) Flash Memory and 4 Mbit (256K x16) SRAM, Multiple Memory Product

PRODUCT PREVIEW

### FEATURES SUMMARY

#### ■ SUPPLY VOLTAGE

- $V_{DDF} = 2.7V$  to  $3.3V$
- $V_{DDS} = V_{DDQF} = 2.7V$  to  $3.3V$
- $V_{PPF} = 12V$  for Fast Program (optional)

#### ■ ACCESS TIME: 70,85ns

#### ■ LOW POWER CONSUMPTION

#### ■ ELECTRONIC SIGNATURE

- Manufacturer Code: 20h
- Top Device Code, M36W432T: 88BAh
- Bottom Device Code, M36W432B: 88BBh

### FLASH MEMORY

#### ■ 32 Mbit (2Mb x16) BOOT BLOCK

- 8 x 4 KWord Parameter Blocks (Top or Bottom Location)

#### ■ PROGRAMMING TIME

- 10 $\mu$ s typical
- Double Word Programming Option

#### ■ BLOCK LOCKING

- All blocks locked at Power up
- Any combination of blocks can be locked
- $\overline{WPF}$  for Block Lock-Down

#### ■ AUTOMATIC STAND-BY MODE

#### ■ PROGRAM and ERASE SUSPEND

#### ■ COMMON FLASH INTERFACE

- 64 bit Security Code

#### ■ SECURITY

- 64 bit user programmable OTP cells
- 64 bit unique device identifier
- One parameter block permanently lockable

### SRAM

#### ■ 4 Mbit (256K x 16 bit)

#### ■ ACCESS TIME: 70ns

#### ■ LOW $V_{DDS}$ DATA RETENTION: 1.5V

#### ■ POWER DOWN FEATURES USING TWO CHIP ENABLE INPUTS

## SUMMARY DESCRIPTION

The M36W432 is a low voltage Multiple Memory Product which combines two memory devices; a 32 Mbit boot block Flash memory and a 4 Mbit SRAM. Recommended operating conditions do not allow both the Flash and the SRAM to be active at the same time.

The memory is offered in a Stacked LFBGA66 (0.8 mm pitch) package and is supplied with all the bits erased (set to '1').

## SIGNAL DESCRIPTIONS

See Figure 2 Logic Diagram and Table 1, Signal Names, for a brief overview of the signals connected to this device.

**Address Inputs (A0-A17).** Addresses A0-A17 are common inputs for the Flash and the SRAM components. The Address Inputs select the cells in the memory array to access during Bus Read operations. During Bus Write operations they control the commands sent to the Command Interface of the internal state machine. The Flash memory is accessed through the Chip Enable ( $\overline{EF}$ ) and Write Enable ( $\overline{WF}$ ) signals, while the SRAM is accessed through two Chip Enable signals ( $\overline{E1S}$  and  $\overline{E2S}$ ) and the Write Enable signal ( $\overline{WS}$ ).

**Address Inputs (A18-A20).** Addresses A18-A20 are inputs for the Flash component only. The Flash memory is accessed through the Chip Enable ( $\overline{EF}$ ) and Write Enable ( $\overline{WF}$ ) signals.

**Data Input/Output (DQ0-DQ15).** The Data I/O outputs the data stored at the selected address

during a Bus Read operation or inputs a command or the data to be programmed during a Write Bus operation.

**Flash Chip Enable ( $\overline{EF}$ ).** The Chip Enable input activates the Flash memory control logic, input buffers, decoders and sense amplifiers. When Chip Enable is at  $V_{IL}$  and Reset is at  $V_{IH}$  the device is in active mode. When Chip Enable is at  $V_{IH}$  the memory is deselected, the outputs are high impedance and the power consumption is reduced to the standby level.

**Flash Output Enable ( $\overline{GF}$ ).** The Output Enable controls the data outputs during the Bus Read operation of the Flash memory.

**Flash Write Enable ( $\overline{WF}$ ).** The Write Enable controls the Bus Write operation of the Flash memory's Command Interface. The data and address inputs are latched on the rising edge of Chip Enable,  $\overline{EF}$ , or Write Enable,  $\overline{WF}$ , whichever occurs first.

**Flash Write Protect ( $\overline{\text{WPF}}$ ).** Write Protect is an input that gives an additional hardware protection for each block. When Write Protect is at  $V_{IL}$ , the Lock-Down is enabled and the protection status of the block cannot be changed. When Write Protect is at  $V_{IH}$ , the Lock-Down is disabled and the block can be locked or unlocked. (refer to Table 6, Read Protection Register and Protection Register Lock).

**Flash Reset ( $\text{RPF}$ ).** The Reset input provides a hardware reset of the Flash memory. When Reset is at  $V_{IL}$ , the memory is in reset mode: the outputs are high impedance and the current consumption is minimized. After Reset all blocks are in the Locked state. When Reset is at  $V_{IH}$ , the device is in normal operation. Exiting reset mode the device enters read array mode, but a negative transition of Chip Enable or a change of the address is required to ensure valid data outputs.

**SRAM Chip Enable ( $\text{E1S}$ ,  $\text{E2S}$ ).** The Chip Enable inputs activate the SRAM memory control logic, input buffers and decoders.  $\text{E1S}$  at  $V_{IH}$  or  $\text{E2S}$  at  $V_{IL}$  deselects the memory and reduces the power consumption to the standby level.  $\text{E1S}$  and  $\text{E2S}$  can also be used to control writing to the SRAM memory array, while  $\overline{\text{WS}}$  remains at  $V_{IL}$ . It is not allowed to set  $\overline{\text{EF}}$  at  $V_{IL}$ ,  $\text{E1S}$  at  $V_{IL}$  and  $\text{E2S}$  at  $V_{IH}$  at the same time.

**SRAM Write Enable ( $\text{WS}$ ).** The Write Enable input controls writing to the SRAM memory array.  $\text{WS}$  is active low.

**SRAM Output Enable ( $\overline{\text{GS}}$ ).** The Output Enable gates the outputs through the data buffers during a read operation of the SRAM memory.  $\overline{\text{GS}}$  is active low.

**SRAM Upper Byte Enable ( $\overline{\text{UBS}}$ ).** The Upper Byte Enable enables the upper bytes for SRAM (DQ8-DQ15).  $\overline{\text{UBS}}$  is active low.

**SRAM Lower Byte Enable ( $\overline{\text{LBS}}$ ).** The Lower Byte Enable enables the lower bytes for SRAM (DQ0-DQ7).  $\overline{\text{LBS}}$  is active low.

**$V_{DDF}$  Supply Voltage (2.7V to 3.3V).**  $V_{DDF}$  provides the power supply to the internal core of the Flash Memory device. It is the main power supply for all operations (Read, Program and Erase).

**$V_{DDQF}$  and  $V_{DDs}$  Supply Voltage (2.7V to 3.3V).**

$V_{DDQF}$  provides the power supply for the Flash memory I/O pins and  $V_{DDs}$  provides the power supply for the SRAM control pins. This allows all Outputs to be powered independently from the Flash core power supply,  $V_{DDF}$ .  $V_{DDQF}$  can be tied to  $V_{DDs}$ .

**$V_{PPF}$  Program Supply Voltage.**  $V_{PPF}$  is both a control input and a power supply pin for the Flash memory. The two functions are selected by the voltage range applied to the pin. The Supply Voltage  $V_{DDF}$  and the Program Supply Voltage  $V_{PPF}$  can be applied in any order.

If  $V_{PPF}$  is kept in a low voltage range (0V to 3.6V)  $V_{PPF}$  is seen as a control input. In this case a voltage lower than  $V_{PPLK}$  gives an absolute protection against program or erase, while  $V_{PPF} > V_{PPLK}$  enables these functions (see Table 14, DC Characteristics for the relevant values).  $V_{PPF}$  is only sampled at the beginning of a program or erase; a change in its value after the operation has started does not have any effect and program or erase operations continue.

If  $V_{PPF}$  is in the range 11.4V to 12.6V it acts as a power supply pin. In this condition  $V_{PPF}$  must be stable until the Program/Erase algorithm is completed (see Table 16 and 17).

**$V_{SSF}$  and  $V_{SSS}$  Ground.**  $V_{SSF}$  and  $V_{SSS}$  are the ground reference for all voltage measurements in the Flash and SRAM chips, respectively.

**Note:** Each device in a system should have  $V_{DDF}$ ,  $V_{DDQF}$  and  $V_{PPF}$  decoupled with a 0.1 $\mu\text{F}$  capacitor close to the pin. See Figure 9, AC Measurement Load Circuit. The PCB trace widths should be sufficient to carry the required  $V_{PPF}$  program and erase currents.

## FUNCTIONAL DESCRIPTION

The Flash and SRAM components have separate power supplies and grounds and are distinguished by three chip enable inputs: EF for the Flash memory and, E1S and E2S for the SRAM.

Recommended operating conditions do not allow both the Flash and the SRAM to be in active mode at the same time. The most common example is

simultaneous read operations on the Flash and the SRAM which would result in a data bus contention. Therefore it is recommended to put the SRAM in the high impedance state when reading the Flash and vice versa (see Table 2 Main Operation Modes for details).

**Figure 4. Functional Block Diagram**

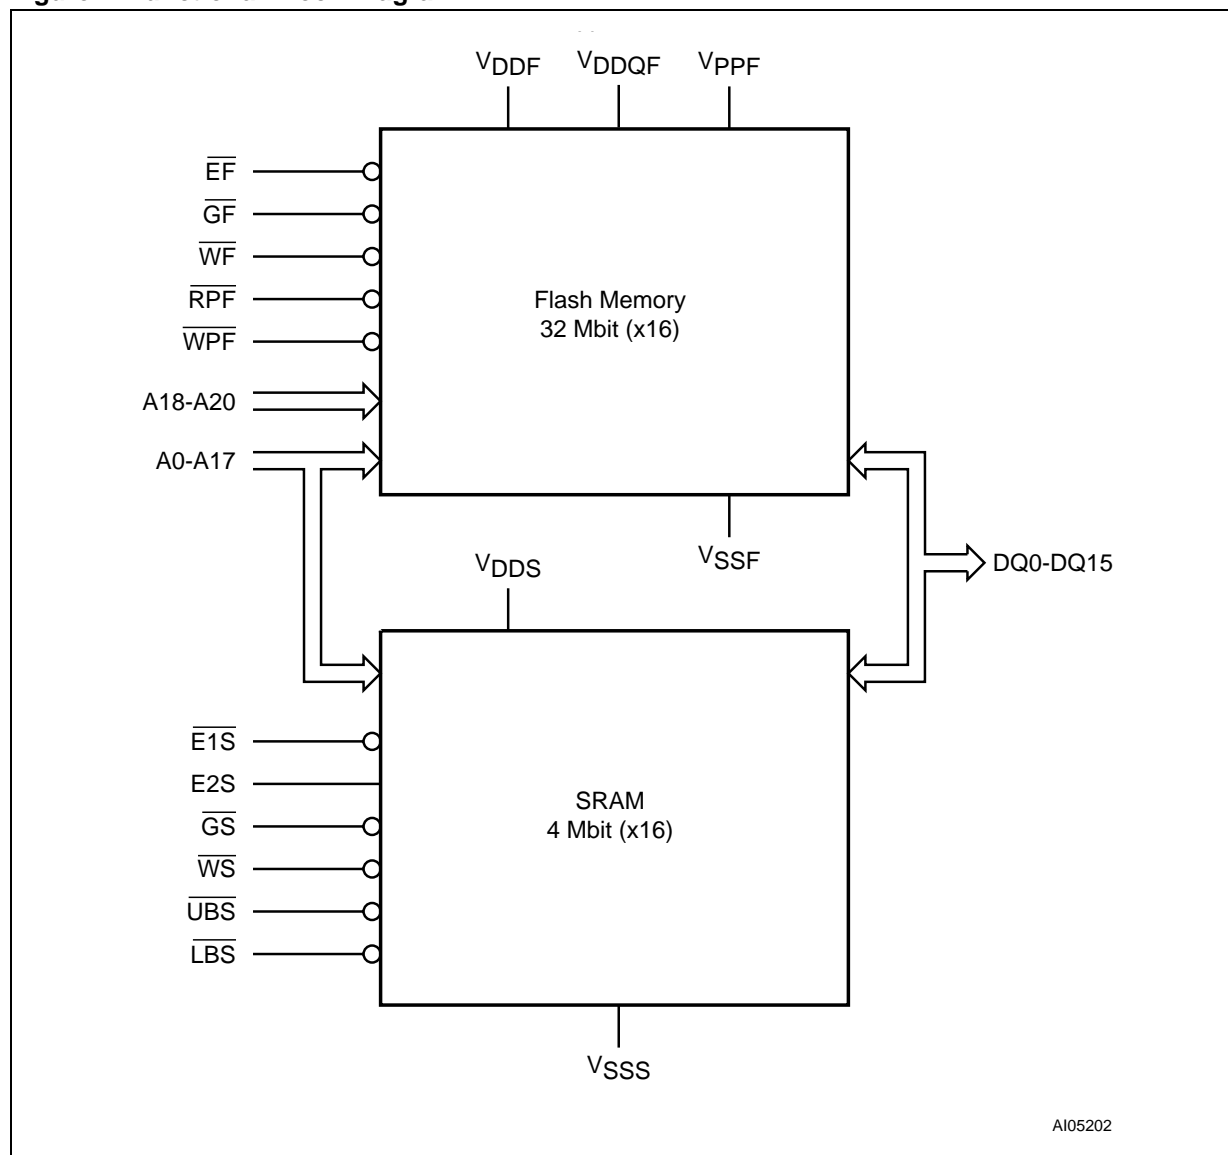

Table 2. Main Operation Modes

Operation Mode		$\overline{EF}$	$\overline{GF}$	$\overline{WF}$	$\overline{RPF}$	$\overline{WPF}$	$V_{PPF}$	$\overline{E1S}$	$E2S$	$\overline{GS}$	$\overline{WS}$	$\overline{UBS}, \overline{LBS}^{(1)}$	DQ15-DQ0
Flash Memory	Read	$V_{IL}$	$V_{IL}$	$V_{IH}$	$V_{IH}$	X	Don't care	SRAM must be disabled					Data Output
	Write	$V_{IL}$	$V_{IH}$	$V_{IL}$	$V_{IH}$	$V_{IH}$	$V_{DDF}$ or $V_{PPFH}$	SRAM must be disabled					Data Input
	Block Locking	$V_{IL}$	X	X	$V_{IH}$	$V_{IL}$	Don't care	SRAM must be disabled					X
	Standby	$V_{IH}$	X	X	$V_{IH}$	X	Don't care	Any SRAM mode is allowed					Hi-Z
	Reset	X	X	X	$V_{IL}$	X	Don't care	Any SRAM mode is allowed					Hi-Z
	Output Disable	$V_{IL}$	$V_{IH}$	$V_{IH}$	$V_{IH}$	X	Don't care	Any SRAM mode is allowed					Hi-Z
SRAM	Read	Flash must be disabled						$V_{IL}$	$V_{IH}$	$V_{IL}$	$V_{IH}$	$V_{IL}$	Data out Word Read
	Write	Flash must be disabled						$V_{IL}$	$V_{IH}$	$V_{IH}$	$V_{IL}$	$V_{IL}$	Data in Word Write
	Standby/ Power Down	Any Flash mode is allowable						$V_{IH}$	X	X	X	X	Hi-Z
								X	$V_{IL}$	X	X	X	Hi-Z
								X	X	X	X	$V_{IH}$	Hi-Z
	Data Retention	Any Flash mode is allowable						$V_{IH}$	X	X	X	X	Hi-Z
								X	$V_{IL}$	X	X	X	Hi-Z
								X	X	X	X	$V_{IH}$	Hi-Z
	Output Disable	Any Flash mode is allowable						$V_{IL}$	$V_{IH}$	$V_{IH}$	$V_{IH}$	X	Hi-Z

Note: X =  $V_{IL}$  or  $V_{IH}$ ,  $V_{PPFH} = 12V \pm 5\%$ .

1. If  $\overline{UBS}$  and  $\overline{LBS}$  are tied together the bus is at 16 bit. For an 8 bit bus configuration use  $\overline{UBS}$  and  $\overline{LBS}$  separately.

### Flash Memory Component

The Flash Memory is a 32 Mbit (2 Mbit x 16) device that can be erased electrically at the block level and programmed in-system on a Word-by-Word basis. These operations can be performed using a single low voltage (2.7 to 3.3V) supply and the  $V_{DDQF}$  for device I/O operation feature the same voltage range. An optional 12V  $V_{PPF}$  power supply is provided to speed up customer programming.

The device features an asymmetrical blocked architecture with an array of 71 blocks: 8 Parameter Blocks of 4 KWord and 63 Main Blocks of 32 KWord. The M36W432T device has the Flash Memory Parameter Blocks at the top of the memory address space while the M36W432B device locates the Parameter Blocks starting from the bottom. The memory maps are shown in Figure 5, Block Addresses.

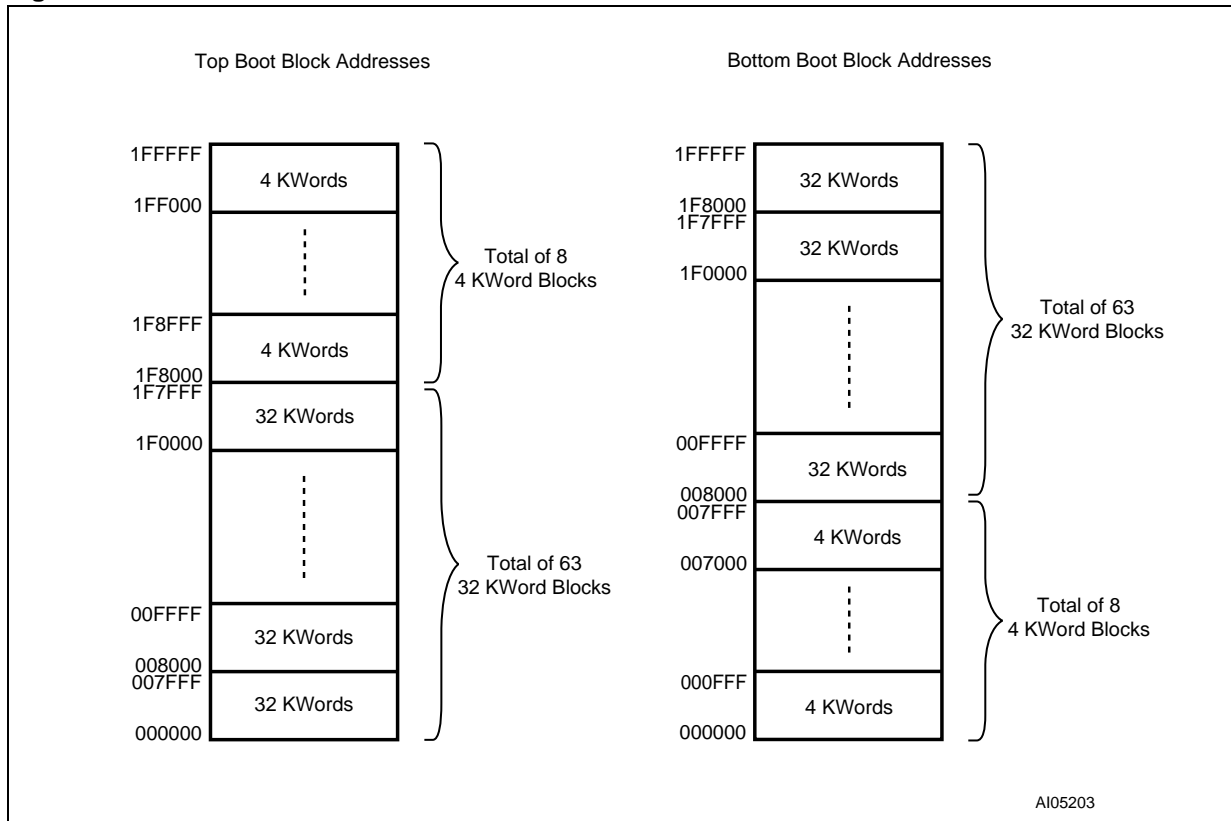

The Flash Memory features an instant, individual block locking scheme that allows any block to be locked or unlocked with no latency, enabling instant code and data protection. All blocks have three levels of protection. They can be locked and locked-down individually preventing any accidental programming or erasure. There is an additional hardware protection against program and erase. When  $V_{PPF} \leq V_{PPLK}$  all blocks are protected

against program or erase. All blocks are locked at Power Up.

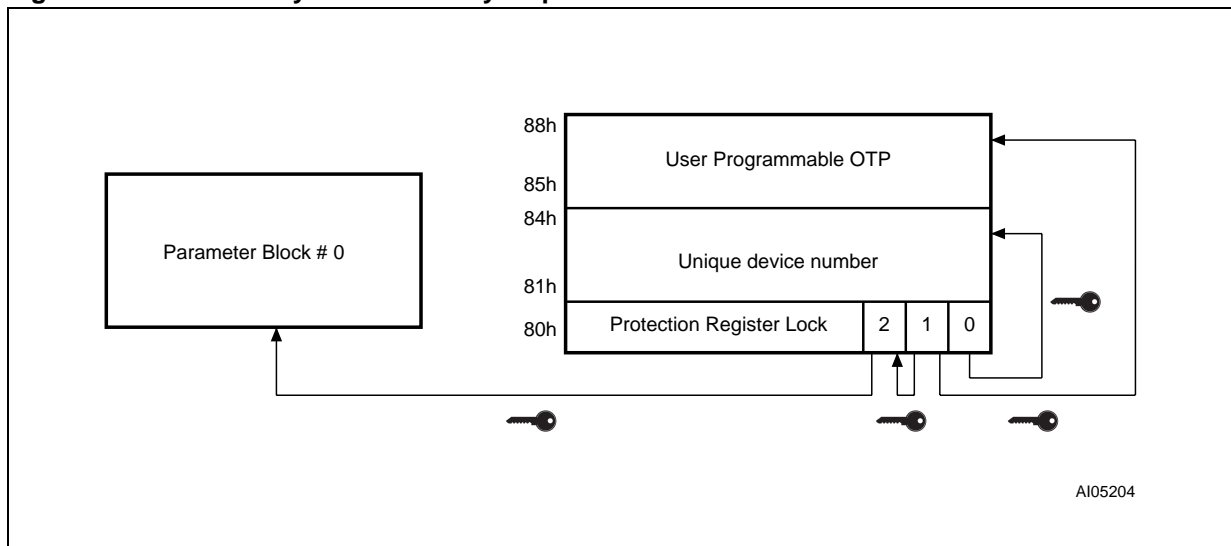

Each block can be erased separately. Erase can be suspended in order to perform either read or program in any other block and then resumed. Program can be suspended to read data in any other block and then resumed. Each block can be programmed and erased over 100,000 cycles.

The device includes a 128 bit Protection Register and a Security Block to increase the protection of a system design. The Protection Register is divided into two 64 bit segments, the first one contains a unique device number written by ST, while the second one is one-time-programmable by the user. The user programmable segment can be permanently protected. The Security Block, parameter block 0, can be permanently protected by the user. Figure 6, shows the Flash Security Block Memory Map.

Program and Erase commands are written to the Command Interface of the memory. An on-chip Program/Erase Controller takes care of the timings necessary for program and erase operations. The end of a program or erase operation can be detected and any error conditions identified. The command set required to control the memory is consistent with JEDEC standards.

**Figure 5. Flash Block Addresses**

Note: Also see Appendix A, Tables 26 and 27 for a full listing of the Flash Block Addresses.

**Figure 6. Flash Security Block Memory Map****SRAM Component**

The SRAM is an 4 Mbit asynchronous random access memory which features a super low voltage operation and low current consumption with an ac-

cess time of 70 ns in all conditions. The memory operations can be performed using a single low voltage supply, 2.7V to 3.3V, which is the same as the Flash voltage supply.

## OPERATING MODES

### Flash Bus Operations

There are six standard bus operations that control the device. These are Bus Read, Bus Write, Output Disable, Standby, Automatic Standby and Reset. See Table 2, Main Operation Modes, for a summary.

Typically glitches of less than 5ns on Chip Enable or Write Enable are ignored by the memory and do not affect bus operations.

**Read.** Read Bus operations are used to output the contents of the Memory Array, the Electronic Signature, the Status Register and the Common Flash Interface. Both Chip Enable and Output Enable must be at  $V_{IL}$  in order to perform a read operation. The Chip Enable input should be used to enable the device. Output Enable should be used to gate data onto the output. The data read depends on the previous command written to the memory (see Command Interface section). See Figure 9, Read Mode AC Waveforms, and Table 15, Flash Read AC Characteristics, for details of when the output becomes valid.

Read mode is the default state of the device when exiting Reset or after power-up.

**Write.** Bus Write operations write Commands to the memory or latch Input Data to be programmed. A write operation is initiated when Chip Enable and Write Enable are at  $V_{IL}$  with Output Enable at  $V_{IH}$ . Commands, Input Data and Addresses are latched on the rising edge of Write Enable or Chip Enable, whichever occurs first.

See Figures 10 and 11, Write AC Waveforms, and Tables 16 and 17, Flash Write AC Characteristics, for details of the timing requirements.

**Output Disable.** The data outputs are high impedance when the Output Enable is at  $V_{IH}$ .

**Standby.** Standby disables most of the internal circuitry allowing a substantial reduction of the current consumption. The memory is in stand-by when Chip Enable is at  $V_{IH}$  and the device is in read mode. The power consumption is reduced to the stand-by level and the outputs are set to high impedance, independently from the Output Enable or Write Enable inputs. If Chip Enable switches to  $V_{IH}$  during a program or erase operation, the device enters Standby mode when finished.

**Automatic Standby.** Automatic Standby provides a low power consumption state during Read mode. Following a read operation, the device enters Automatic Standby after 150ns of bus inactivity even if Chip Enable is Low,  $V_{IL}$ , and the supply current is reduced to  $I_{DD1}$ . The data Inputs/Outputs

will still output data if a bus Read operation is in progress.

**Reset.** During Reset mode when Output Enable is Low,  $V_{IL}$ , the memory is deselected and the outputs are high impedance. The memory is in Reset mode when Reset is at  $V_{IL}$ . The power consumption is reduced to the Standby level, independently from the Chip Enable, Output Enable or Write Enable inputs. If Reset is pulled to  $V_{SS}$  during a Program or Erase, this operation is aborted and the memory content is no longer valid.

### Flash Command Interface

All Bus Write operations to the memory are interpreted by the Command Interface. Commands consist of one or more sequential Bus Write operations. An internal Program/Erase Controller handles all timings and verifies the correct execution of the Program and Erase commands. The Program/Erase Controller provides a Status Register whose output may be read at any time during, to monitor the progress of the operation, or the Program/Erase states. See Appendix 29, Table 34, Write State Machine Current/Next, for a summary of the Command Interface.

The Command Interface is reset to Read mode when power is first applied, when exiting from Reset or whenever  $V_{DDF}$  is lower than  $V_{LKO}$ . Command sequences must be followed exactly. Any invalid combination of commands will reset the device to Read mode. Refer to Table 3, Commands, in conjunction with the text descriptions below.

**Read Memory Array Command.** The Read command returns the memory to its Read mode. One Bus Write cycle is required to issue the Read Memory Array command and return the memory to Read mode. Subsequent read operations will read the addressed location and output the data. When a device Reset occurs, the memory defaults to Read mode.

**Read Status Register Command.** The Status Register indicates when a program or erase operation is complete and the success or failure of the operation itself. Issue a Read Status Register command to read the Status Register's contents. Subsequent Bus Read operations read the Status Register at any address, until another command is issued. See Table 10, Status Register Bits, for details on the definitions of the bits.

The Read Status Register command may be issued at any time, even during a Program/Erase operation. Any Read attempt during a Program/Erase operation will automatically output the content of the Status Register.

**Read Electronic Signature Command.** The Read Electronic Signature command reads the Manufacturer and Device Codes and the Block Locking Status, or the Protection Register.

The Read Electronic Signature command consists of one write cycle, a subsequent read will output the Manufacturer Code, the Device Code, the Block Lock and Lock-Down Status, or the Protection and Lock Register. See Tables 4, 5 and 6 for the valid address.

**Read CFI Query Command.** The Read Query Command is used to read data from the Common Flash Interface (CFI) Memory Area, allowing programming equipment or applications to automatically match their interface to the characteristics of the device. One Bus Write cycle is required to issue the Read Query Command. Once the command is issued subsequent Bus Read operations read from the Common Flash Interface Memory Area. See Appendix B, Common Flash Interface, Tables 28, 29, 30, 31, 32 and 33 for details on the information contained in the Common Flash Interface memory area.

**Block Erase Command.** The Block Erase command can be used to erase a block. It sets all the bits within the selected block to '1'. All previous data in the block is lost. If the block is protected then the Erase operation will abort, the data in the block will not be changed and the Status Register will output the error.

Two Bus Write cycles are required to issue the command.

- The first bus cycle sets up the Erase command.
- The second latches the block address in the internal state machine and starts the Program/Erase Controller.

If the second bus cycle is not Write Erase Confirm (D0h), Status Register bits b4 and b5 are set and the command aborts.

Erase aborts if Reset turns to  $V_{IL}$ . As data integrity cannot be guaranteed when the Erase operation is aborted, the block must be erased again.

During Erase operations the memory will accept the Read Status Register command and the Program/Erase Suspend command, all other commands will be ignored. Typical Erase times are given in Table 7, Program, Erase Times and Program/Erase Endurance Cycles.

See Appendix C, Figure 28, Erase Flowchart and Pseudo Code, for a suggested flowchart for using the Erase command.

**Program Command.** The memory array can be programmed word-by-word. Two bus write cycles are required to issue the Program Command.

- The first bus cycle sets up the Program command.
- The second latches the Address and the Data to be written and starts the Program/Erase Controller.

During Program operations the memory will accept the Read Status Register command and the Program/Erase Suspend command. Typical Program times are given in Table 7, Program, Erase Times and Program/Erase Endurance Cycles.

Programming aborts if Reset goes to  $V_{IL}$ . As data integrity cannot be guaranteed when the program operation is aborted, the block containing the memory location must be erased and reprogrammed.

See Appendix C, Figure 25, Program Flowchart and Pseudo Code, for the flowchart for using the Program command.

**Double Word Program Command.** This feature is offered to improve the programming throughput, writing a page of two adjacent words in parallel. The two words must differ only for the address A0. Programming should not be attempted when  $V_{PPF}$  is not at  $V_{PPH}$ . The command can be executed if  $V_{PPF}$  is below  $V_{PPH}$  but the result is not guaranteed.

Three bus write cycles are necessary to issue the Double Word Program command.

- The first bus cycle sets up the Double Word Program Command.
- The second bus cycle latches the Address and the Data of the first word to be written.
- The third bus cycle latches the Address and the Data of the second word to be written and starts the Program/Erase Controller.

Read operations output the Status Register content after the programming has started. Programming aborts if Reset goes to  $V_{IL}$ . As data integrity cannot be guaranteed when the program operation is aborted, the block containing the memory location must be erased and reprogrammed.

See Appendix C, Figure 26, Double Word Program Flowchart and Pseudo Code, for the flowchart for using the Double Word Program command.

**Clear Status Register Command.** The Clear Status Register command can be used to reset bits 1, 3, 4 and 5 in the Status Register to '0'. One bus write cycle is required to issue the Clear Status Register command.

The bits in the Status Register do not automatically return to '0' when a new Program or Erase command is issued. The error bits in the Status Register should be cleared before attempting a new Program or Erase command.

**Program/Erase Suspend Command.** The Program/Erase Suspend command is used to pause a Program or Erase operation. One bus write cycle is required to issue the Program/Erase command and pause the Program/Erase controller.

During Program/Erase Suspend the Command Interface will accept the Program/Erase Resume, Read Array, Read Status Register, Read Electronic Signature and Read CFI Query commands. Additionally, if the suspend operation was Erase then the Program, Block Lock, Block Lock-Down or Protection Program commands will also be accepted. The block being erased may be protected by issuing the Block Protect, Block Lock or Protection Program commands. When the Program/Erase Resume command is issued the operation will complete. Only the blocks not being erased may be read or programmed correctly.

During a Program/Erase Suspend, the device can be placed in a pseudo-standby mode by taking Chip Enable to  $V_{IH}$ . Program/Erase is aborted if Reset turns to  $V_{IL}$ .

See Appendix C, Figure 27, Program or Double Word Program Suspend & Resume Flowchart and Pseudo Code, and Figure 29, Erase Suspend & Resume Flowchart and Pseudo Code for flowcharts for using the Program/Erase Suspend command.

**Program/Erase Resume Command.** The Program/Erase Resume command can be used to restart the Program/Erase Controller after a Program/Erase Suspend operation has paused it. One Bus Write cycle is required to issue the command. Once the command is issued subsequent Bus Read operations read the Status Register.

See Appendix C, Figure 27, Program or Double Word Program Suspend & Resume Flowchart and Pseudo Code, and Figure 29, Erase Suspend & Resume Flowchart and Pseudo Code for flowcharts for using the Program/Erase Resume command.

**Protection Register Program Command.** The Protection Register Program command is used to Program the 64 bit user One-Time-Programmable (OTP) segment of the Protection Register. The segment is programmed 16 bits at a time. When shipped all bits in the segment are set to '1'. The user can only program the bits to '0'.

Two write cycles are required to issue the Protection Register Program command.

- The first bus cycle sets up the Protection Register Program command.

- The second latches the Address and the Data to be written to the Protection Register and starts the Program/Erase Controller.

Read operations output the Status Register content after the programming has started.

The segment can be protected by programming bit 1 of the Protection Lock Register. Bit 1 of the Protection Lock Register protects bit 2 of the Protection Lock Register. Programming bit 2 of the Protection Lock Register will result in a permanent protection of the Security Block (see Figure 6, Flash Security Block Memory Map). Attempting to program a previously protected Protection Register will result in a Status Register error. The protection of the Protection Register and/or the Security Block is not reversible.

The Protection Register Program cannot be suspended.

**Block Lock Command.** The Block Lock command is used to lock a block and prevent Program or Erase operations from changing the data in it. All blocks are locked at power-up or reset.

Two Bus Write cycles are required to issue the Block Lock command.

- The first bus cycle sets up the Block Lock command.
- The second Bus Write cycle latches the block address.

The Lock Status can be monitored for each block using the Read Block Signature command. Table. 9 shows the Lock Status after issuing a Block Lock command.

The Block Lock bits are volatile, once set they remain set until reset or power-down/power-up. They are cleared by a Blocks Unlock command. Refer to the section, Block Locking, for a detailed explanation.

**Block Unlock Command.** The Blocks Unlock command is used to unlock a block, allowing the block to be programmed or erased. Two Bus Write cycles are required to issue the Blocks Unlock command.

- The first bus cycle sets up the Block Unlock command.
- The second Bus Write cycle latches the block address.

The Lock Status can be monitored for each block using the Read Block Signature command. Table. 9 shows the Lock Status after issuing a Block Unlock command. Refer to the section, Block Locking, for a detailed explanation.

**Block Lock-Down Command.** A locked block cannot be Programmed or Erased, or have its Lock status changed when  $\overline{WP}$  is low,  $V_{IL}$ . When  $\overline{WP}$  is high,  $V_{IH}$ , the Lock-Down function is disabled and the locked blocks can be individually unlocked by the Block Unlock command.

Two Bus Write cycles are required to issue the Block Lock command.

- The first bus cycle sets up the Block Lock command.

- The second Bus Write cycle latches the block address.

The Lock Status can be monitored for each block using the Read Block Signature command. Locked blocks revert to the protected (and not locked) state when the device is reset on power-down. Table 9 shows the Lock Status after issuing a Block Lock-Down command. Refer to the section, Block Locking, for a detailed explanation.

**Table 3. Commands**

Commands	No. of Cycles	Bus Write Operations								
		1st Cycle			2nd Cycle			3rd Cycle		
		Bus Op.	Addr	Data	Bus Op.	Addr	Data	Bus Op.	Addr	Data
Read Memory Array	1+	Write	X	FFh	Read	Read Addr	Data			
Read Status Register	1+	Write	X	70h	Read	X	Status Register			
Read Electronic Signature	1+	Write	X	90h	Read	Signature Addr <sup>(1)</sup>	Signature			
Read CFI Query	1+	Write	55h	98h	Read	CFI Addr	Query			
Erase	2	Write	X	20h	Write	Block Addr	D0h			
Program	2	Write	X	40h or 10h	Write	Addr	Data Input			
Double Word Program <sup>(2)</sup>	3	Write	X	30h	Write	Addr 1	Data Input	Write	Addr 2	Data Input
Clear Status Register	1	Write	X	50h						
Program/Erase Suspend	1	Write	X	B0h						
Program/Erase Resume	1	Write	X	D0h						
Block Lock	2	Write	X	60h	Write	Block Address	01h			
Block Unlock	2	Write	X	60h	Write	Block Address	D0h			
Block Lock-Down	2	Write	X	60h	Write	Block Address	2Fh			
Protection Register Program	2	Write	X	C0h	Write	Address	Data Input			

Note: X = Don't Care.

1. The signature addresses are listed in Tables 4, 5 and 6.

2. Addr 1 and Addr 2 must be consecutive Addresses differing only for A0.

**Table 4. Read Electronic Signature**

Code	Device	$\overline{EF}$	$\overline{GF}$	$\overline{WF}$	A0	A1	A2-A7	A8-A11	A12-A20	DQ0-DQ7	DQ8-DQ15

Parameter Block Erase	$V_{PPF} = 12V \pm 5\%$		0.8	10	s
	$V_{PPF} = V_{DDF}$		0.8	10	s
Program/Erase Cycles (per Block)		100,000			cycles

### Flash Block Locking

The Flash Memory features an instant, individual block locking scheme that allows any block to be locked or unlocked with no latency. This locking scheme has three levels of protection.

- Lock/Unlock - this first level allows software-only control of block locking.
- Lock-Down - this second level requires hardware interaction before locking can be changed.
- $V_{PPF} \leq V_{PPLK}$  - the third level offers a complete hardware protection against program and erase on all blocks.

The locking status of each block can be set to Locked, Unlocked, and Lock-Down. The following sections explain the operation of the locking system. Table 7, defines all of the possible locking states (WP, DQ1, DQ0), and Appendix C, Figure 30, shows a flowchart for the locking operations.

**Locked State.** The default status of all blocks on power-up or reset is Locked (states (0,0,1) or (1,0,1)). Locked blocks are fully protected from any program or erase. Any program or erase operations attempted on a locked block will return an error in the Status Register. The Status of a Locked block can be changed to Unlocked or Lock-Down using the appropriate software commands. An Unlocked block can be Locked by issuing the Lock command.

**Unlocked State.** Unlocked blocks (states (0,0,0), (1,0,0) (1,1,0)), can be programmed or erased. All unlocked blocks return to the Locked state when the device is reset or powered-down. The status of an unlocked block can be changed to Locked or Locked-Down using the appropriate software commands. A locked block can be unlocked by issuing the Unlock command.

**Lock-Down State.** Blocks that are Locked-Down (state (0,1,1)) are protected from program and erase operations (as for Locked blocks) but their Lock status cannot be changed using software commands alone. A Locked or Unlocked block can be Locked-Down by issuing the Lock-Down command. Locked-Down blocks revert to the Locked state when the device is reset or powered-down.

The Lock-Down function is dependent on the  $\overline{WPF}$  input pin. When  $WPF=0$  ( $V_{IL}$ ), the blocks in the Lock-Down state (0,1,1) are protected from program, erase and lock status changes. When  $WPF=1$  ( $V_{IH}$ ) the Lock-Down function is disabled (1,1,1) and Locked-Down blocks can be individually unlocked to the (1,1,0) state by issuing the software command, where they can be erased and programmed. These blocks can then be re-locked (1,1,1) and unlocked (1,1,0) as desired while  $WPF$  remains high. When  $WPF$  is low, blocks that were previously Locked-Down return to the Lock-Down state (0,1,1) regardless of any changes made while  $WPF$  was high. Device reset or power-down resets all blocks, including those in Lock-Down, to the Locked state.

**Reading a Block's Lock Status.** The lock status of every block can be read in the Read Electronic Signature mode of the device. To enter this mode write 90h to the device. Subsequent reads at Block Address 00002h will output the lock status of that block. The lock status is represented by DQ0 and DQ1. DQ0 indicates the Block Lock/Unlock status and is set by the Lock command and cleared by the Unlock command. It is also automatically set when entering Lock-Down. DQ1 indicates the Lock-Down status and is set by the Lock-Down command. It cannot be cleared by software, only by a device reset or power-down.

#### Locking Operations During Erase Suspend.

Changes to block lock status can be performed during an erase suspend by using the standard locking command sequences to unlock, lock or lock-down a block. This is useful in the case when another block needs to be updated while an erase operation is in progress.

To change block locking during an erase operation, first write the Erase Suspend command, then check the status register until it indicates that the erase operation has been suspended. Next write the desired Lock command sequence to a block and the lock status will be changed. After completing any desired lock, read, or program operations, resume the erase operation with the Erase Resume command.

If a block is locked or locked-down during an erase suspend of the same block, the locking status bits will be changed immediately, but when the erase is resumed, the erase operation will complete.

Locking operations cannot be performed during a program suspend. Refer to Appendix D, Command Interface and Program/Erase Controller State, for detailed information on which commands are valid during erase suspend.

**Table 8. Block Lock Status**

Item	Address	Data
Block Lock Configuration	xx002	LOCK
Block is Unlocked		DQ0=0
Block is Locked		DQ0=1
Block is Locked-Down		DQ1=1

**Table 9. Lock Status**

Current Lock Status <sup>(1)</sup> (WPF, DQ1, DQ0)		Next Lock Status <sup>(1)</sup> (WPF, DQ1, DQ0)			
Current State	Program/Erase Allowed	After Block Lock Command	After Block Unlock Command	After Block Lock-Down Command	After WPF transition
1,0,0	yes	1,0,1	1,0,0	1,1,1	0,0,0
1,0,1 <sup>(2)</sup>	no	1,0,1	1,0,0	1,1,1	0,0,1
1,1,0	yes	1,1,1	1,1,0	1,1,1	0,1,1
1,1,1	no	1,1,1	1,1,0	1,1,1	0,1,1
0,0,0	yes	0,0,1	0,0,0	0,1,1	1,0,0
0,0,1 <sup>(2)</sup>	no	0,0,1	0,0,0	0,1,1	1,0,1
0,1,1	no	0,1,1	0,1,1	0,1,1	1,1,1 or 1,1,0 <sup>(3)</sup>

Note: 1. The lock status is defined by the write protect pin and by DQ1 ('1' for a locked-down block) and DQ0 ('1' for a locked block) as read in the Read Electronic Signature command with A1 = V<sub>IH</sub> and A0 = V<sub>IL</sub>.

2. All blocks are locked at power-up, so the default configuration is 001 or 101 according to WPF status.

3. A WPF transition to V<sub>IH</sub> on a locked block will restore the previous DQ0 value, giving a 111 or 110.

### Flash Status Register

The Status Register provides information on the current or previous Program or Erase operation. The various bits convey information and errors on the operation. To read the Status register the Read Status Register command can be issued, refer to Read Status Register Command section. To output the contents, the Status Register is latched on the falling edge of the Chip Enable or Output Enable signals, and can be read until Chip Enable or Output Enable returns to  $V_{IH}$ . Either Chip Enable or Output Enable must be toggled to update the latched data.

Bus Read operations from any address always read the Status Register during Program and Erase operations.

The bits in the Status Register are summarized in Table 10, Status Register Bits. Refer to Table 10 in conjunction with the following text descriptions.

**Program/Erase Controller Status (Bit 7).** The Program/Erase Controller Status bit indicates whether the Program/Erase Controller is active or inactive. When the Program/Erase Controller Status bit is Low (set to '0'), the Program/Erase Controller is active; when the bit is High (set to '1'), the Program/Erase Controller is inactive, and the device is ready to process a new command.

The Program/Erase Controller Status is Low immediately after a Program/Erase Suspend command is issued until the Program/Erase Controller pauses. After the Program/Erase Controller pauses the bit is High.

During Program, Erase, operations the Program/Erase Controller Status bit can be polled to find the end of the operation. Other bits in the Status Register should not be tested until the Program/Erase Controller completes the operation and the bit is High.

After the Program/Erase Controller completes its operation the Erase Status, Program Status,  $V_{PPF}$  Status and Block Lock Status bits should be tested for errors.

**Erase Suspend Status (Bit 6).** The Erase Suspend Status bit indicates that an Erase operation has been suspended or is going to be suspended. When the Erase Suspend Status bit is High (set to '1'), a Program/Erase Suspend command has been issued and the memory is waiting for a Program/Erase Resume command.

The Erase Suspend Status should only be considered valid when the Program/Erase Controller Status bit is High (Program/Erase Controller inactive). Bit 7 is set within 30 $\mu$ s of the Program/Erase Suspend command being issued therefore the memory may still complete the operation rather than entering the Suspend mode.

pend command being issued therefore the memory may still complete the operation rather than entering the Suspend mode.

When a Program/Erase Resume command is issued the Erase Suspend Status bit returns Low.

**Erase Status (Bit 5).** The Erase Status bit can be used to identify if the memory has failed to verify that the block has erased correctly. When the Erase Status bit is High (set to '1'), the Program/Erase Controller has applied the maximum number of pulses to the block and still failed to verify that the block has erased correctly. The Erase Status bit should be read once the Program/Erase Controller Status bit is High (Program/Erase Controller inactive).

Once set High, the Erase Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set High it should be reset before a new Program or Erase command is issued, otherwise the new command will appear to fail.

**Program Status (Bit 4).** The Program Status bit is used to identify a Program failure. When the Program Status bit is High (set to '1'), the Program/Erase Controller has applied the maximum number of pulses to the byte and still failed to verify that it has programmed correctly. The Program Status bit should be read once the Program/Erase Controller Status bit is High (Program/Erase Controller inactive).

Once set High, the Program Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set High it should be reset before a new command is issued, otherwise the new command will appear to fail.

**$V_{PPF}$  Status (Bit 3).** The  $V_{PPF}$  Status bit can be used to identify an invalid voltage on the  $V_{PPF}$  pin during Program and Erase operations. The  $V_{PPF}$  pin is only sampled at the beginning of a Program or Erase operation. Indeterminate results can occur if  $V_{PPF}$  becomes invalid during an operation.

When the  $V_{PPF}$  Status bit is Low (set to '0'), the voltage on the  $V_{PPF}$  pin was sampled at a valid voltage; when the  $V_{PPF}$  Status bit is High (set to '1'), the  $V_{PPF}$  pin has a voltage that is below the  $V_{PPF}$  Lockout Voltage,  $V_{PPLK}$ , the memory is protected and Program and Erase operations cannot be performed.

Once set High, the  $V_{PPF}$  Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set High it should be reset before a new Program or Erase command is issued, otherwise the new command will appear to fail.

**Program Suspend Status (Bit 2).** The Program Suspend Status bit indicates that a Program operation has been suspended. When the Program Suspend Status bit is High (set to '1'), a Program/Erase Suspend command has been issued and the memory is waiting for a Program/Erase Resume command. The Program Suspend Status should only be considered valid when the Program/Erase Controller Status bit is High (Program/Erase Controller inactive). Bit 2 is set within 5 $\mu$ s of the Program/Erase Suspend command being issued therefore the memory may still complete the operation rather than entering the Suspend mode. When a Program/Erase Resume command is issued the Program Suspend Status bit returns Low.

**Block Protection Status (Bit 1).** The Block Protection Status bit can be used to identify if a Program or Erase operation has tried to modify the contents of a locked block.

When the Block Protection Status bit is High (set to '1'), a Program or Erase operation has been attempted on a locked block.

Once set High, the Block Protection Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set High it should be reset before a new command is issued, otherwise the new command will appear to fail.

**Reserved (Bit 0).** Bit 0 of the Status Register is reserved. Its value must be masked.

**Note:** Refer to Appendix C, Flowcharts and Pseudo Codes, for using the Status Register.

**Table 10. Status Register Bits**

Bit	Name	Logic Level	Definition
7	P/E.C. Status	'1'	Ready
		'0'	Busy
6	Erase Suspend Status	'1'	Suspended
		'0'	In progress or Completed
5	Erase Status	'1'	Erase Error
		'0'	Erase Success
4	Program Status	'1'	Program Error
		'0'	Program Success
3	V <sub>PPF</sub> Status	'1'	V <sub>PPF</sub> Invalid, Abort
		'0'	V <sub>PPF</sub> OK
2	Program Suspend Status	'1'	Suspended
		'0'	In Progress or Completed
1	Block Protection Status	'1'	Program/Erase on protected block, Abort
		'0'	No operation to protected blocks
0	Reserved		

Note: Logic level '1' is High, '0' is Low.

### SRAM Operations

There are five standard operations that control the SRAM component. These are Bus Read, Bus Write, Standby/Power-down, Data Retention and Output Disable. A summary is shown in Table 2, Main Operation Modes

**Read.** Read operations are used to output the contents of the SRAM Array. The SRAM is in Read mode whenever Write Enable,  $\overline{WS}$ , is at  $V_{IH}$ , Output Enable, GS, is at  $V_{IL}$ , Chip Enable, E1S, is at

$V_{IL}$ , Chip Enable, E2S, is at  $V_{IH}$ , and Byte Enables, UBS and LBS are at  $V_{IL}$ .

Valid data will be available on the output pins after a time of  $t_{AVQV}$  after the last stable address. If the Chip Enable or Output Enable access times are not met, data access will be measured from the limiting parameter ( $t_{E1LQV}$ ,  $t_{E2HQV}$ , or  $t_{GLQV}$ ) rather than the address. Data out may be indeterminate at  $t_{E1LQX}$ ,  $t_{E2HQX}$  and  $t_{GLQX}$ , but data lines will always be valid at  $t_{AVQV}$  (see Table 19, Figures 13 and 14).

**Write.** Write operations are used to write data to the SRAM. The SRAM is in Write mode whenever  $\overline{WS}$  and  $\overline{E1S}$  are at  $V_{IL}$  and  $E2S$  is at  $V_{IH}$ . Either the Chip Enable inputs,  $\overline{E1S}$  and  $E2S$ , or the Write Enable input,  $\overline{WS}$ , must be deasserted during address transitions for subsequent write cycles.

A Write operation is initiated when  $\overline{E1S}$  is at  $V_{IL}$ ,  $E2S$  is at  $V_{IH}$  and  $\overline{WS}$  is at  $V_{IL}$ . The data is latched on the falling edge of  $\overline{E1S}$ , the rising edge of  $E2S$  or the falling edge of  $\overline{WS}$ , whichever occurs last. The Write cycle is terminated on the rising edge of  $\overline{E1S}$ , the rising edge of  $\overline{WS}$  or the falling edge of  $E2S$ , whichever occurs first.

If the Output is enabled ( $\overline{E1S}=V_{IL}$ ,  $E2S=V_{IH}$  and  $\overline{GS}=V_{IL}$ ), then  $\overline{WS}$  will return the outputs to high impedance within  $t_{WLQZ}$  of its falling edge. Care must be taken to avoid bus contention in this type of operation. The Data input must be valid for  $t_{D_{VWH}}$  before the rising edge of  $\overline{Write}$  Enable, for  $t_{DVE1H}$  before the rising edge of  $\overline{E1S}$  or for  $t_{DVE2L}$  before the falling edge of  $E2S$ , whichever occurs

first, and remain valid for  $t_{WHDX}$ ,  $t_{E1HAX}$  or  $t_{E2LAX}$  (see Table 20, Figure 16, 17, 18 and 19).

**Standby/Power-Down.** The SRAM component has a chip enabled power-down feature which invokes an automatic standby mode (see Table 19, Figure 15). The SRAM is in Standby mode whenever either Chip Enable is deasserted,  $\overline{E1S}$  at  $V_{IH}$  or  $E2S$  at  $V_{IL}$ .

**Data Retention.** The SRAM data retention performances as  $V_{DDS}$  goes down to  $V_{DR}$  are described in Table 21 and Figure 20, 21. In  $\overline{E1S}$  controlled data retention mode, the minimum standby current mode is entered when  $\overline{E1S} \geq V_{DDS} - 0.2V$  and  $E2S \leq 0.2V$  or  $E2S \geq V_{DDS} - 0.2V$ . In  $E2S$  controlled data retention mode, minimum standby current mode is entered when  $E2S \leq 0.2V$ .

**Output Disable.** The data outputs are high impedance when the Output Enable,  $\overline{GS}$ , is at  $V_{IH}$  with Write Enable,  $\overline{WS}$ , at  $V_{IH}$ .

## MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 11. Absolute Maximum Ratings**

Symbol	Parameter	Value		Unit
		Min	Max	
$T_A$	Ambient Operating Temperature <sup>(1)</sup>	-40	85	°C
$T_{BIAS}$	Temperature Under Bias	-40	125	°C
$T_{STG}$	Storage Temperature	-55	155	°C
$V_{IO}$	Input or Output Voltage	-0.5	$V_{DDQF} + 0.3$	V
$V_{DDF}, V_{DDQF}$	Flash Supply Voltage	-0.6	3.9	V
$V_{PPF}$	Program Voltage	-0.6	13	V
$V_{DDS}$	SRAM Supply Voltage	-0.5	3.9	V

Note: 1. Depends on range.

## DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics Tables that follow, are derived from tests performed under the Measure-

ment Conditions summarized in Table 12, Operating and AC Measurement Conditions. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

**Table 12. Operating and AC Measurement Conditions**

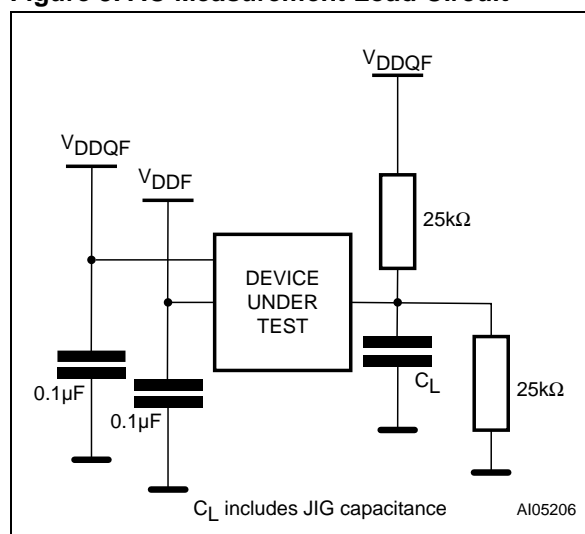

Parameter	SRAM		Flash Memory		Units
	70		70/85		
	Min	Max	Min	Max	
V <sub>DDF</sub> Supply Voltage	–	–	2.7	3.3	V
V <sub>DDQ F</sub> = V <sub>DDS</sub> Supply Voltage	2.7	3.3	2.7	3.3	V
Ambient Operating Temperature	– 40	85	– 40	85	°C
Load Capacitance (C <sub>L</sub> )	50		50		pF
Input Rise and Fall Times		5		5	ns
Input Pulse Voltages	0 to V <sub>DDQF</sub>		0 to V <sub>DDQF</sub>		V
Input and Output Timing Ref. Voltages	V <sub>DDQF</sub> /2		V <sub>DDQF</sub> /2		V

**Figure 7. AC Measurement I/O Waveform**

Note:  $V_{DDQ}$  means  $V_{DDQF} = V_{DDS}$

**Figure 8. AC Measurement Load Circuit**

**Table 13. Device Capacitance**

Symbol	Parameter	Test Condition	Typ	Max	Unit
$C_{IN}$	Input Capacitance	$V_{IN} = 0V$ , $f = 1\text{ MHz}$	12	14	pF
$C_{OUT}$	Output Capacitance	$V_{OUT} = 0V$ , $f = 1\text{ MHz}$	20	22	pF

Note: Sampled only, not 100% tested.

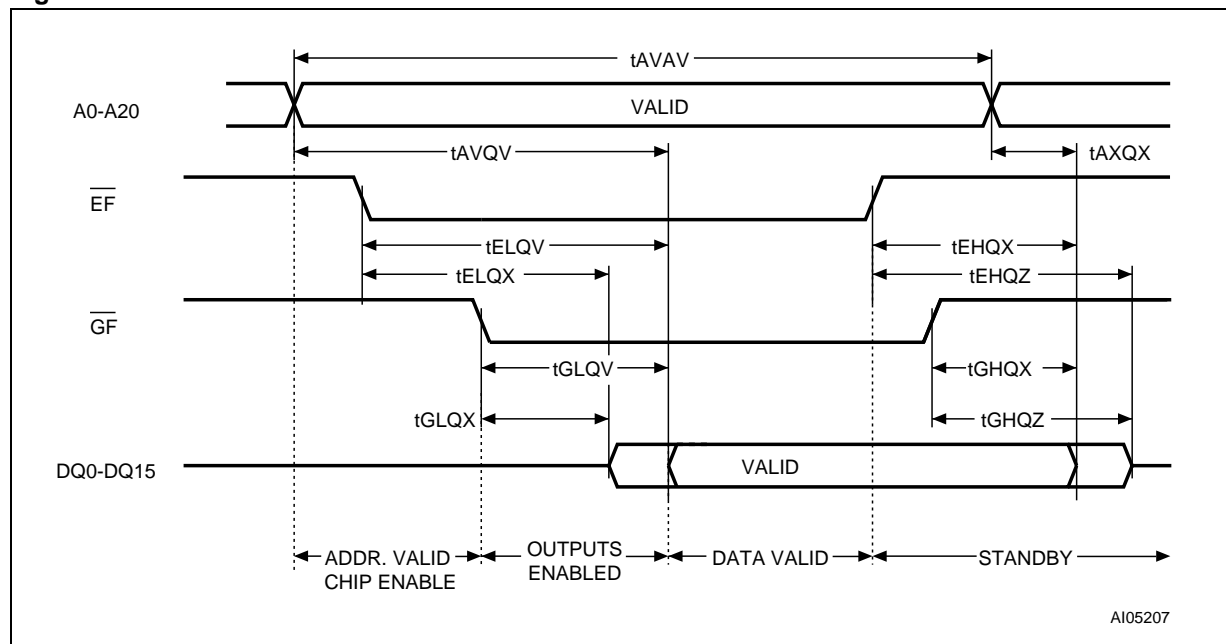

Table 14. DC Characteristics

Symbol	Parameter	Device	Test Condition	Min	Typ	Max	Unit
$I_{LI}$	Input Leakage Current	Flash & SRAM	$0V \leq V_{IN} \leq V_{DDQF}$			$\pm 2$	$\mu A$
$I_{LO}$	Output Leakage Current	Flash & SRAM	$0V \leq V_{OUT} \leq V_{DDQF}$ , SRAM Outputs Hi-Z			$\pm 10$	$\mu A$
$I_{DDs}$	$V_{DD}$ Standby Current	Flash	$\overline{EF} = V_{DDQF} \pm 0.2V$ $V_{DDQF} = V_{DDF} \text{ max}$		15	50	$\mu A$
		SRAM	$\overline{E1S} = E2S \geq V_{DDs} - 0.2V$ or $E2S \leq 0.2V$		20	50	$\mu A$
$I_{DDd}$	Supply Current (Reset)	Flash	$\overline{RPF} = V_{SSF} \pm 0.2V$		15	50	$\mu A$
$I_{DD}$	Supply Current	SRAM	$V_{IN} \leq V_{DDs} - 0.2V$ or $V_{IN} \leq 0.2V$ $I_{IO} = 0 \text{ mA}$ , cycle time = $1\mu s$		1	2	mA
			$V_{IN} \leq V_{DDs} - 0.2V$ or $V_{IN} \leq 0.2V$ $I_{IO} = 0 \text{ mA}$ , min cycle time		7	12	mA
$I_{DDR}$	Supply Current (Read)	Flash	$\overline{EF} = V_{IL}$ , $\overline{GF} = V_{IH}$ , $f = 5 \text{ MHz}$		10	20	mA
$I_{DDW}$	Supply Current (Program)	Flash	Program in progress		10	20	mA
$I_{DDE}$	Supply Current (Erase)	Flash	Erase in progress		5	20	mA
$I_{DDES}$	Supply Current (Erase Suspend)	Flash	Erase Suspend in progress			50	$\mu A$
$I_{DDWS}$	Supply Current (Program Suspend)	Flash	Program Suspend in progress			50	$\mu A$
$I_{PPS}$	Program Current (Standby)	Flash	$V_{PPF} \leq V_{DDQF}$		0.2	5	$\mu A$
			$V_{PPF} > V_{DDF}$		100	400	$\mu A$
$I_{PPR}$	Program Current (Read)	Flash	$V_{PPF} \leq V_{DDQF}$		0.2	5	$\mu A$
			$V_{PPF} = V_{DDF}$		100	400	$\mu A$
$I_{PPW}$	Program Current (Program)	Flash	$V_{PPF} = 12V \pm 0.6V$ Program in progress		5	10	mA
$I_{PPE}$	Program Current (Erase)	Flash	$V_{PPF} = 12V \pm 0.6V$ Program in progress		5	10	mA
$V_{IL}$	Input Low Voltage	Flash & SRAM	$V_{DDQF} = V_{DDs} \geq 2.7V$	-0.3		0.8	V
$V_{IH}$	Input High Voltage	Flash & SRAM	$V_{DDQF} = V_{DDs} \geq 2.7V$	2.2		$V_{DDQF} + 0.3$	V
$V_{OL}$	Output Low Voltage	Flash & SRAM	$V_{DDQF} = V_{DDs} = V_{DD} \text{ min}$ $I_{OL} = 100\mu A$			0.1	V
$V_{OH}$	Output High Voltage	Flash & SRAM	$V_{DDQF} = V_{DDs} = V_{DD} \text{ min}$ $I_{OH} = -100\mu A$	$V_{DDQ} - 0.1$			V
$V_{PPL}$	Program Voltage (Program or Erase operations)	Flash		2.7		3.3	V

## M36W432T, M36W432B

Symbol	Parameter	Device	Test Condition	Min	Typ	Max	Unit
V <sub>PPH</sub>	Program Voltage (Program or Erase operations)	Flash		11.4		12.6	V
V <sub>PPLK</sub>	Program Voltage (Program and Erase lock-out)	Flash				1	V
V <sub>LKO</sub>	V <sub>DDF</sub> Supply Voltage (Program and Erase lock-out)	Flash				2	V

t <sub>PD</sub> <sup>(1)</sup>		Chip Enable 1 High or Chip Enable 2 Low to Power Down		70	ns
t <sub>PU</sub> <sup>(1)</sup>		Chip Enable 1 Low or Chip Enable 2 High to Power Up	0		ns

Note: 1. Sampled only. Not 100% tested.

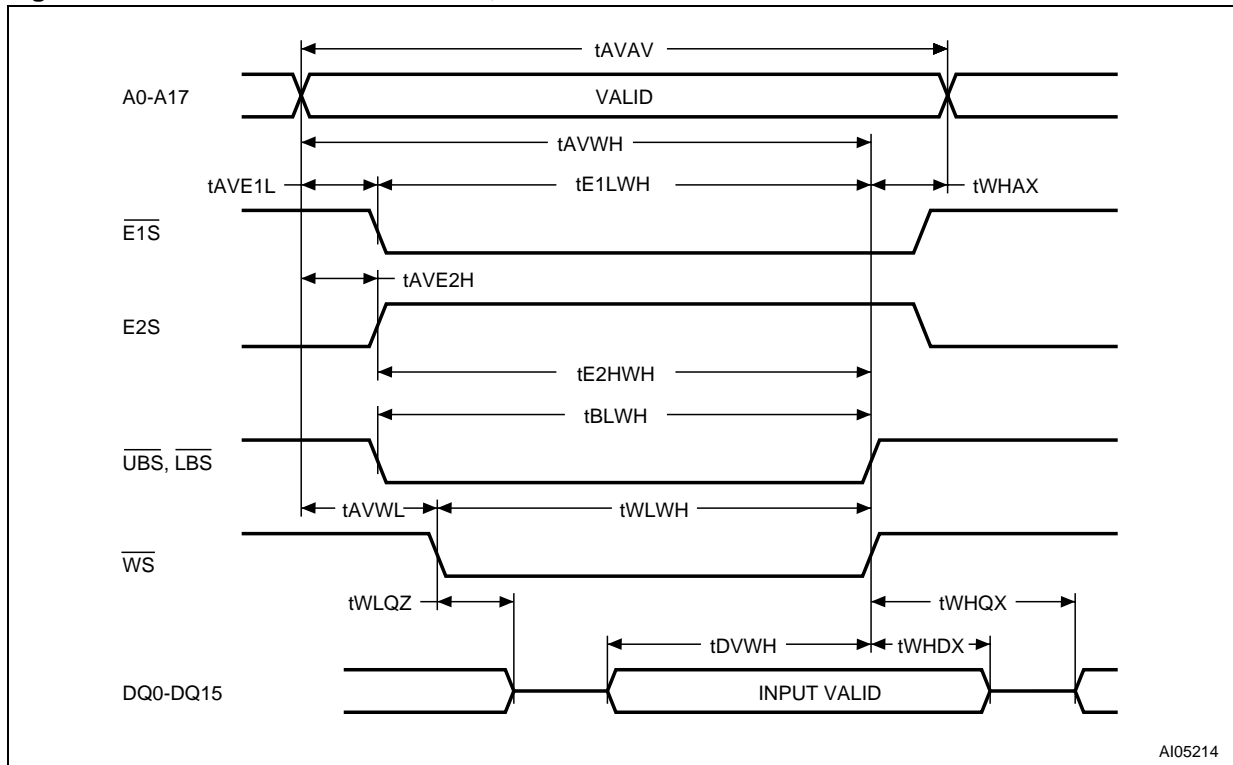

Figure 16. SRAM Write AC Waveforms,  $\overline{WS}$  Controlled with  $\overline{GS}$  LowFigure 17. SRAM Write AC Waveforms,  $\overline{WS}$  Controlled with  $\overline{GS}$  High

Figure 18. SRAM Write AC Waveforms,  $\overline{\text{UBS}}$  and  $\overline{\text{LBS}}$  Controlled

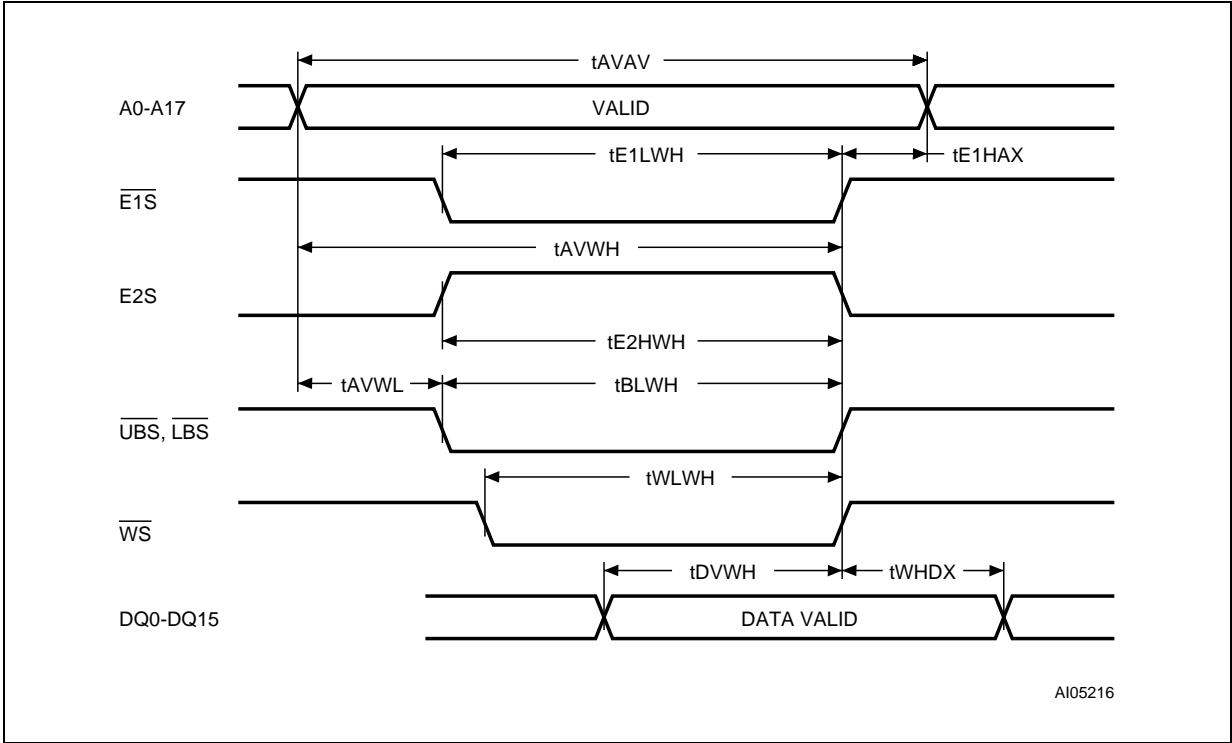

Figure 19. SRAM Write AC Waveforms,  $\overline{\text{E1S}}$  Controlled

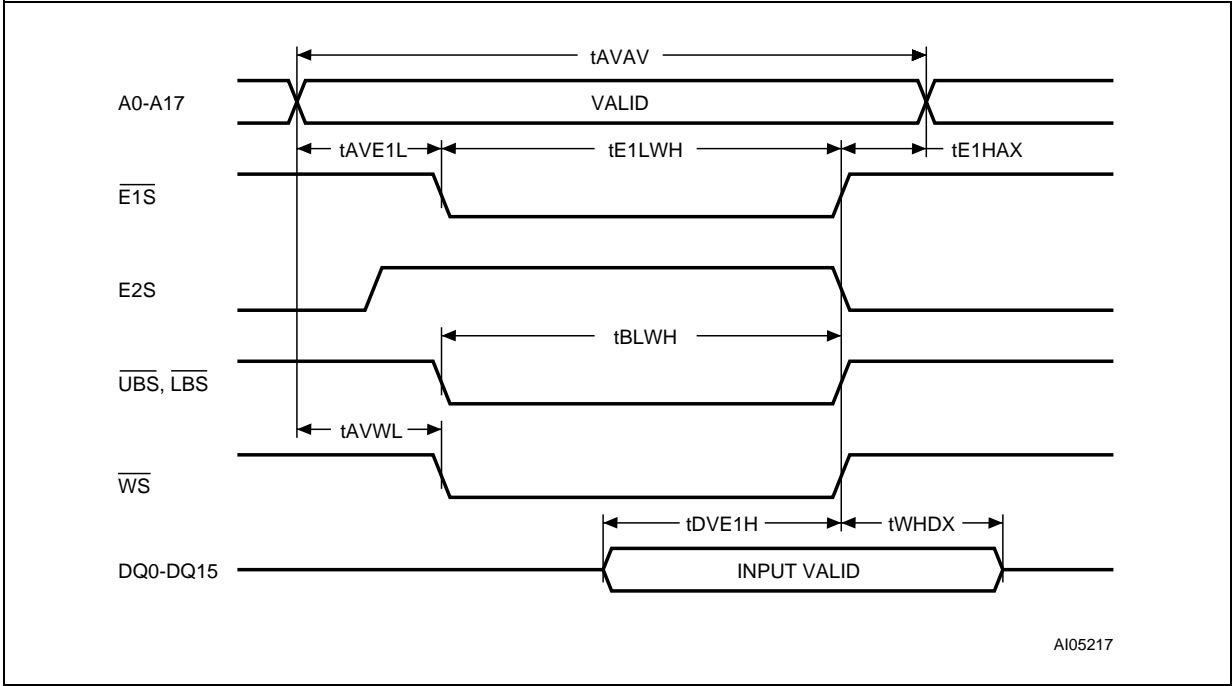

Table 20. SRAM Write AC Characteristics

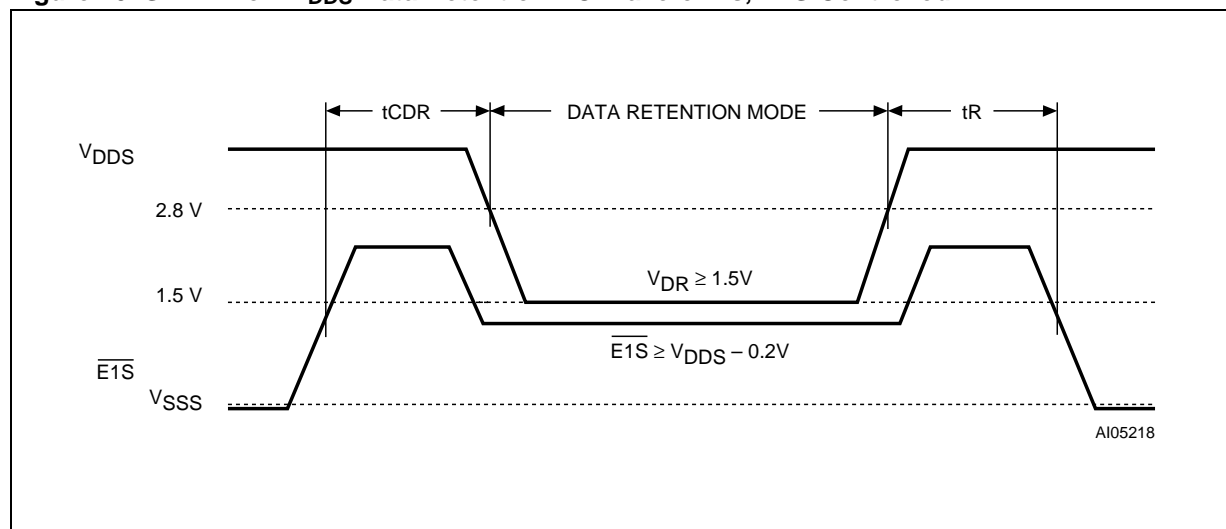

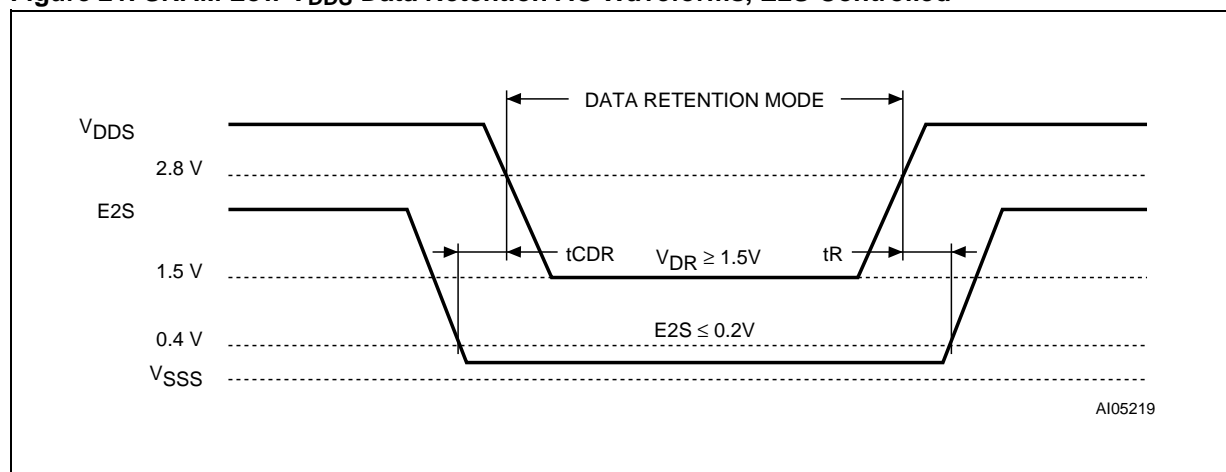

Symbol	Alt	Parameter	SRAM		Unit
			Min	Max	
$t_{AVAV}$	$t_{WC}$	Write Cycle Time	70		ns
$t_{AVE1L}$	$t_{AS}^{(1)}$	Address Valid to Chip Enable 1 Low	0		ns
$t_{AVE2H}$	$t_{AS}^{(1)}$	Address Valid to Chip Enable 2 High	0		ns
$t_{AVWH}$	$t_{AW}$	Address Valid to Write Enable High	60		ns
$t_{AVWL}$	$t_{AS}^{(1)}$	Address Valid to Write Enable Low	0		ns
$t_{BLWH}$	$t_{BW}$	$\overline{UBS}$ , $\overline{LBS}$ Valid to End of Write	60		ns
$t_{DVE1H}$	$t_{DW}$	Input Valid to Chip Enable 1 High	30		ns
$t_{DVE2L}$	$t_{DW}$	Input Valid to Chip Enable 2 Low	30		ns
$t_{DVWH}$	$t_{DW}$	Input Valid to Write Enable High	30		ns
$t_{E1HAX}$	$t_{WR}^{(2)}$	Chip Enable 1 High to Address Transition	0		ns
$t_{E1LWH}$ , $t_{E2HWH}$	$t_{CW}^{(3)}$	Chip Select to End of Write	60		ns
$t_{E2LAX}$	$t_{WR}^{(2)}$	Chip Enable 2 Low to Address Transition	0		ns
$t_{GHQZ}$	$t_{GHZ}$	Output Enable High to Output Hi-Z		25	ns
$t_{WHAX}$	$t_{WR}^{(2)}$	Write Enable High to Address Transition	0		ns
$t_{WHDX}$	$t_{DH}$	Write Enable High to Input Transition	0		ns
$t_{WHQX}$	$t_{OW}$	Write Enable High to Output Transition	10		ns
$t_{WLQZ}$	$t_{WHZ}$	Write Enable Low to Output Hi-Z		25	ns
$t_{WLWH}$	$t_{WP}^{(4)}$	Write Enable Pulse Width	50		ns

Note: 1.  $t_{AS}$  is measured from the address valid to the beginning of write.

2.  $t_{WR}$  is measured from the end of write to the address change.  $t_{WR}$  applied in case a write ends as  $\overline{E1S}$  or  $\overline{WS}$  going high.

3.  $t_{CW}$  is measured from  $\overline{E1S}$  going low end of write.

4. A Write occurs during the overlap ( $t_{WP}$ ) of low  $\overline{E1S}$  and low  $\overline{WS}$ . A write begins when  $\overline{E1S}$  goes low and  $\overline{WS}$  goes low with asserting  $\overline{UBS}$  or  $\overline{LBS}$  for single byte operation or simultaneously asserting  $\overline{UBS}$  and  $\overline{LBS}$  for double byte operation. A write ends at the earliest transition when  $\overline{E1S}$  goes high and  $\overline{WS}$  goes high. The  $t_{WP}$  is measured from the beginning of write to the end of write.

Figure 20. SRAM Low  $V_{DDS}$  Data Retention AC Waveforms,  $\overline{E1S}$  ControlledFigure 21. SRAM Low  $V_{DDs}$  Data Retention AC Waveforms, E2S ControlledTable 21. SRAM Low  $V_{DDs}$  Data Retention Characteristic

Symbol	Parameter	Test Condition	Min	Max	Unit
$I_{DDDR}$	Supply Current (Data Retention)	$V_{DDs} = 3.3V$ , $\overline{E1S} \geq V_{DDs} - 0.2V$ , $E2S \geq V_{DDs} - 0.2V$ or $E2S \leq 0.2V$		15	$\mu A$
$V_{DR}$	Supply Voltage (Data Retention)	$\overline{E1S} \geq V_{DDs} - 0.2V$ , $E2S \leq 0.2V$	1.5	3.3	V
$t_{CDR}$	Chip Disable to Power Down	$\overline{E1S} \geq V_{DDs} - 0.2V$ , $E2S \leq 0.2V$	0		ns
$t_R$	Operation Recovery Time		$t_{RC}$		ns

Note: 1. All other Inputs  $V_{IH} \leq V_{DD} - 0.2V$  or  $V_{IL} \leq 0.2V$ .  
 2. Sampled only. Not 100% tested.

**APPENDIX B. COMMON FLASH INTERFACE (CFI)**

The Common Flash Interface is a JEDEC approved, standardized data structure that can be read from the Flash memory device. It allows a system software to query the device to determine various electrical and timing parameters, density information and functions supported by the memory. The system can interface easily with the device, enabling the software to upgrade itself when necessary.

When the CFI Query Command (RCFI) is issued the device enters CFI Query mode and the data

structure is read from the memory. Tables 28, 29, 30, 31, 32 and 33 show the addresses used to retrieve the data.

The CFI data structure also contains a security area where a 64 bit unique security number is written (see Table 33, Security Code area). This area can be accessed only in Read mode by the final user. It is impossible to change the security number after it has been written by ST. Issue a Read command to return to Read mode.

**Table 28. Query Structure Overview**

Offset	Sub-section Name	Description
00h	Reserved	Reserved for algorithm-specific information
10h	CFI Query Identification String	Command set ID and algorithm data offset
1Bh	System Interface Information	Device timing & voltage information
27h	Device Geometry Definition	Flash device layout
P	Primary Algorithm-specific Extended Query table	Additional information specific to the Primary Algorithm (optional)
A	Alternate Algorithm-specific Extended Query table	Additional information specific to the Alternate Algorithm (optional)

Note: Query data are always presented on the lowest order data outputs.

**Table 29. CFI Query Identification String**

Offset	Data	Description	Value
00h	0020h	Manufacturer Code	ST
01h	88BAh 88BBh	Device Code	Top Bottom
02h-0Fh	reserved	Reserved	
10h 11h 12h	0051h 0052h 0059h	Query Unique ASCII String "QRY"	"Q" "R" "Y"
13h 14h	0003h 0000h	Primary Algorithm Command Set and Control Interface ID code 16 bit ID code defining a specific algorithm	Intel compatible
15h 16h	0035h 0000h	Address for Primary Algorithm extended Query table (see Table 31)	P = 35h
17h 18h	0000h 0000h	Alternate Vendor Command Set and Control Interface ID Code second vendor - specified algorithm supported (0000h means none exists)	NA
19h 1Ah	0000h 0000h	Address for Alternate Algorithm extended Query table (0000h means none exists)	NA

Note: Query data are always presented on the lowest order data outputs (DQ7-DQ0) only. DQ8-DQ15 are '0'.

Table 30. CFI Query System Interface Information

Offset	Data	Description	Value
1Bh	0027h	V <sub>DD</sub> Logic Supply Minimum Program/Erase or Write voltage bit 7 to 4 BCD value in volts bit 3 to 0 BCD value in 100 mV	2.7V
1Ch	0036h	V <sub>DD</sub> Logic Supply Maximum Program/Erase or Write voltage bit 7 to 4 BCD value in volts bit 3 to 0 BCD value in 100 mV	3.6V
1Dh	00B4h	V <sub>PP</sub> [Programming] Supply Minimum Program/Erase voltage bit 7 to 4 HEX value in volts bit 3 to 0 BCD value in 100 mV	11.4V
1Eh	00C6h	V <sub>PP</sub> [Programming] Supply Maximum Program/Erase voltage bit 7 to 4 HEX value in volts bit 3 to 0 BCD value in 100 mV	12.6V
1Fh	0004h	Typical timeout per single word program = 2 <sup>n</sup> μs	16μs
20h	0004h	Typical timeout for Double Word Program = 2 <sup>n</sup> μs	16μs
21h	000Ah	Typical timeout per individual block erase = 2 <sup>n</sup> ms	1s
22h	0000h	Typical timeout for full chip erase = 2 <sup>n</sup> ms	NA
23h	0005h	Maximum timeout for word program = 2 <sup>n</sup> times typical	512μs
24h	0005h	Maximum timeout for Double Word Program = 2 <sup>n</sup> times typical	512μs
25h	0003h	Maximum timeout per individual block erase = 2 <sup>n</sup> times typical	8s
26h	0000h	Maximum timeout for chip erase = 2 <sup>n</sup> times typical	NA

Table 31. Device Geometry Definition

Offset Word Mode		Data	Description	Value
27h		0016h	Device Size = $2^n$ in number of bytes	4 MByte
28h 29h		0001h 0000h	Flash Device Interface Code description	x16 Async.
2Ah 2Bh		0002h 0000h	Maximum number of bytes in multi-byte program or page = $2^n$	4
2Ch		0002h	Number of Erase Block Regions within the device. It specifies the number of regions within the device containing contiguous Erase Blocks of the same size.	2
M36W432T	2Dh 2Eh	003Eh 0000h	Region 1 Information Number of identical-size erase block = $003Eh+1$	63
	2Fh 30h	0000h 0001h	Region 1 Information Block size in Region 1 = $0100h * 256$ byte	64 KByte
	31h 32h	0007h 0000h	Region 2 Information Number of identical-size erase block = $0007h+1$	8
	33h 34h	0020h 0000h	Region 2 Information Block size in Region 2 = $0020h * 256$ byte	8 KByte
M36W432B	2Dh 2Eh	0007h 0000h	Region 1 Information Number of identical-size erase block = $0007h+1$	8
	2Fh 30h	0020h 0000h	Region 1 Information Block size in Region 1 = $0020h * 256$ byte	8 KByte
	31h 32h	003Eh 0000h	Region 2 Information Number of identical-size erase block = $003Eh+1$	63
	33h 34h	0000h 0001h	Region 2 Information Block size in Region 2 = $0100h * 256$ byte	64 KByte

Table 32. Primary Algorithm-Specific Extended Query Table

Offset P = 35h <sup>(1)</sup>	Data	Description	Value
(P+0)h = 35h	0050h	Primary Algorithm extended Query table unique ASCII string "PRI"	"P"
(P+1)h = 36h	0052h		"R"
(P+2)h = 37h	0049h		"I"
(P+3)h = 38h	0031h	Major version number, ASCII	"1"
(P+4)h = 39h	0030h	Minor version number, ASCII	"0"
(P+5)h = 3Ah	0066h	Extended Query table contents for Primary Algorithm. Address (P+5)h contains less significant byte.  bit 0 Chip Erase supported (1 = Yes, 0 = No) bit 1 Suspend Erase supported (1 = Yes, 0 = No) bit 2 Suspend Program supported (1 = Yes, 0 = No) bit 3 Legacy Lock/Unlock supported (1 = Yes, 0 = No) bit 4 Queued Erase supported (1 = Yes, 0 = No) bit 5 Instant individual block locking supported (1 = Yes, 0 = No) bit 6 Protection bits supported (1 = Yes, 0 = No) bit 7 Page mode read supported (1 = Yes, 0 = No) bit 8 Synchronous read supported (1 = Yes, 0 = No) bit 31 to 9 Reserved; undefined bits are '0'	No
(P+6)h = 3Bh	0000h		Yes
(P+7)h = 3Ch	0000h		Yes
(P+8)h = 3Dh	0000h		No
			No
			Yes
			Yes
			No
			No
			No
(P+9)h = 3Eh	0001h	Supported Functions after Suspend Read Array, Read Status Register and CFI Query are always supported during Erase or Program operation bit 0 Program supported after Erase Suspend (1 = Yes, 0 = No) bit 7 to 1 Reserved; undefined bits are '0'	Yes
(P+A)h = 3Fh	0003h	Block Lock Status : Defines which bits in the Block Status Register section of the Query are implemented. Address (P+A)h contains less significant byte bit 0 Block Lock Status bit active (1 = Yes, 0 = No) bit 1 Block Lock-Down Status bit active (1 = Yes, 0 = No) bit 15 to 2 Reserved for future use; undefined bits are '0'	Yes Yes
(P+B)h = 40h	0000h		
(P+C)h = 41h	0030h	V <sub>DD</sub> Logic Supply Optimum Program/Erase voltage (highest performance) bit 7 to 4 HEX value in volts bit 3 to 0 BCD value in 100 mV	3V
(P+D)h = 42h	00C0h	V <sub>PP</sub> Supply Optimum Program/Erase voltage bit 7 to 4 HEX value in volts bit 3 to 0 BCD value in 100 mV	12V
(P+E)h = 43h	0001h	Number of Protection register fields in JEDEC ID space. "00h," indicates that 256 protection bytes are available	01
(P+F)h = 44h	0080h	Protection Field 1: Protection Description This field describes user-available. One Time Programmable (OTP) Protection register bytes. Some are pre-programmed with device unique serial numbers. Others are user programmable. Bits 0–15 point to the Protection register Lock byte, the section's first byte. The following bytes are factory pre-programmed and user-programmable. bit 0 to 7 Lock/bytes JEDEC-plane physical low address bit 8 to 15 Lock/bytes JEDEC-plane physical high address bit 16 to 23 "n" such that 2 <sup>n</sup> = factory pre-programmed bytes bit 24 to 31 "n" such that 2 <sup>n</sup> = user programmable bytes	80h
(P+10)h = 45h	0000h		00h
(P+11)h = 46h	0003h		8 Byte
(P+12)h = 47h	0003h		8 Byte
(P+13)h = 48h		Reserved	

Note: 1. See Table 29, offset 15 for P pointer definition.

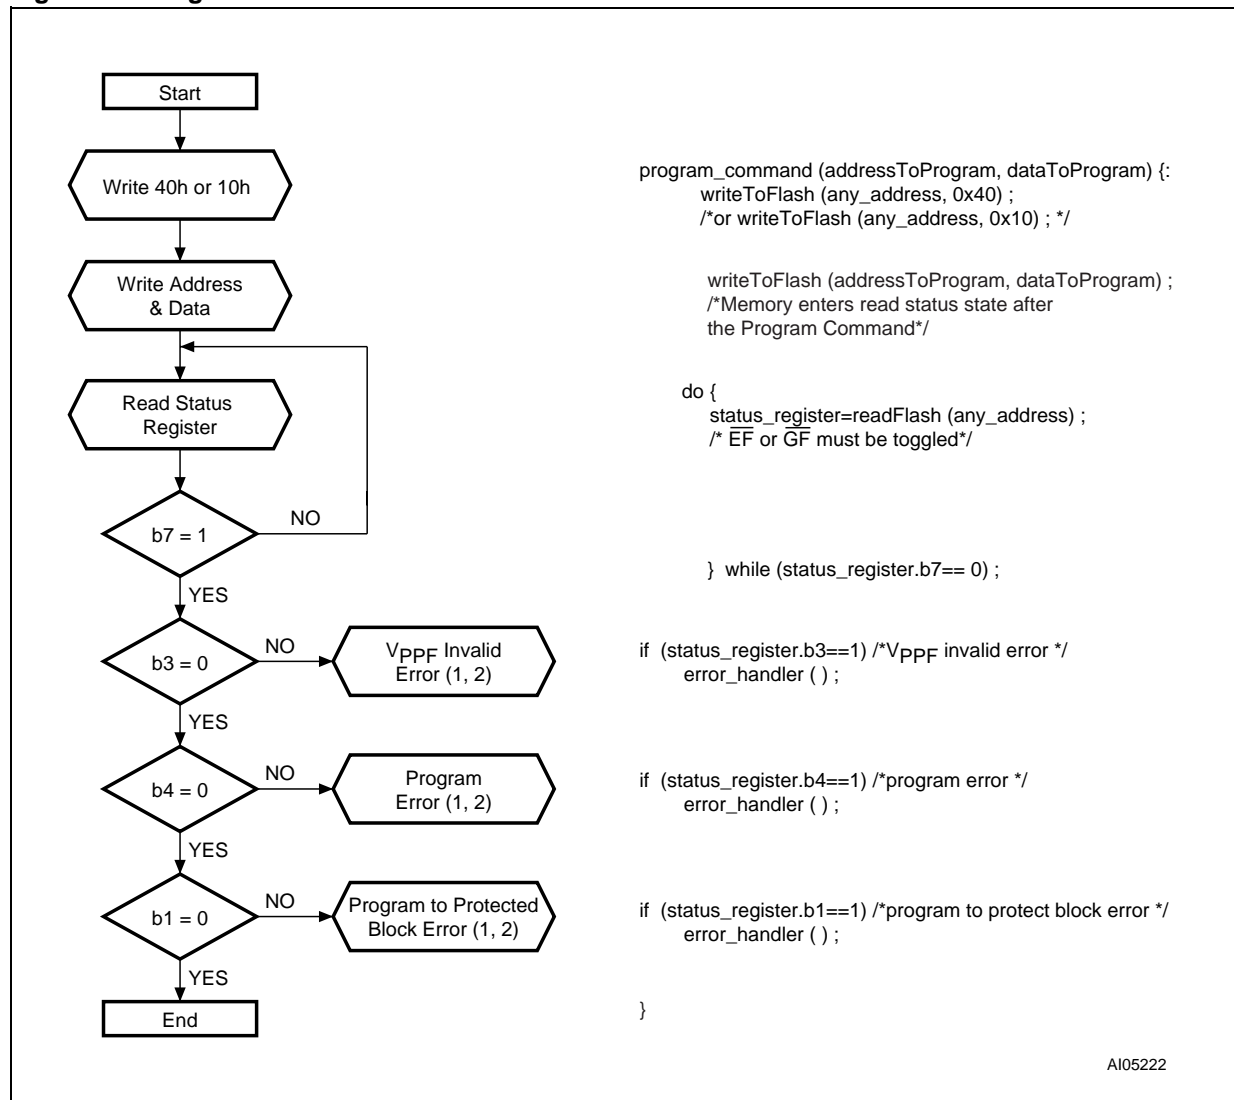

**Table 33. Security Code Area**

Offset	Data	Description
80h	00XX	Protection Register Lock
81h	XXXX	64 bits: unique device number
82h	XXXX	
83h	XXXX	
84h	XXXX	
85h	XXXX	64 bits: User Programmable OTP
86h	XXXX	
87h	XXXX	
88h	XXXX	

## APPENDIX C. FLASH MEMORY FLOWCHARTS AND PSEUDO CODES

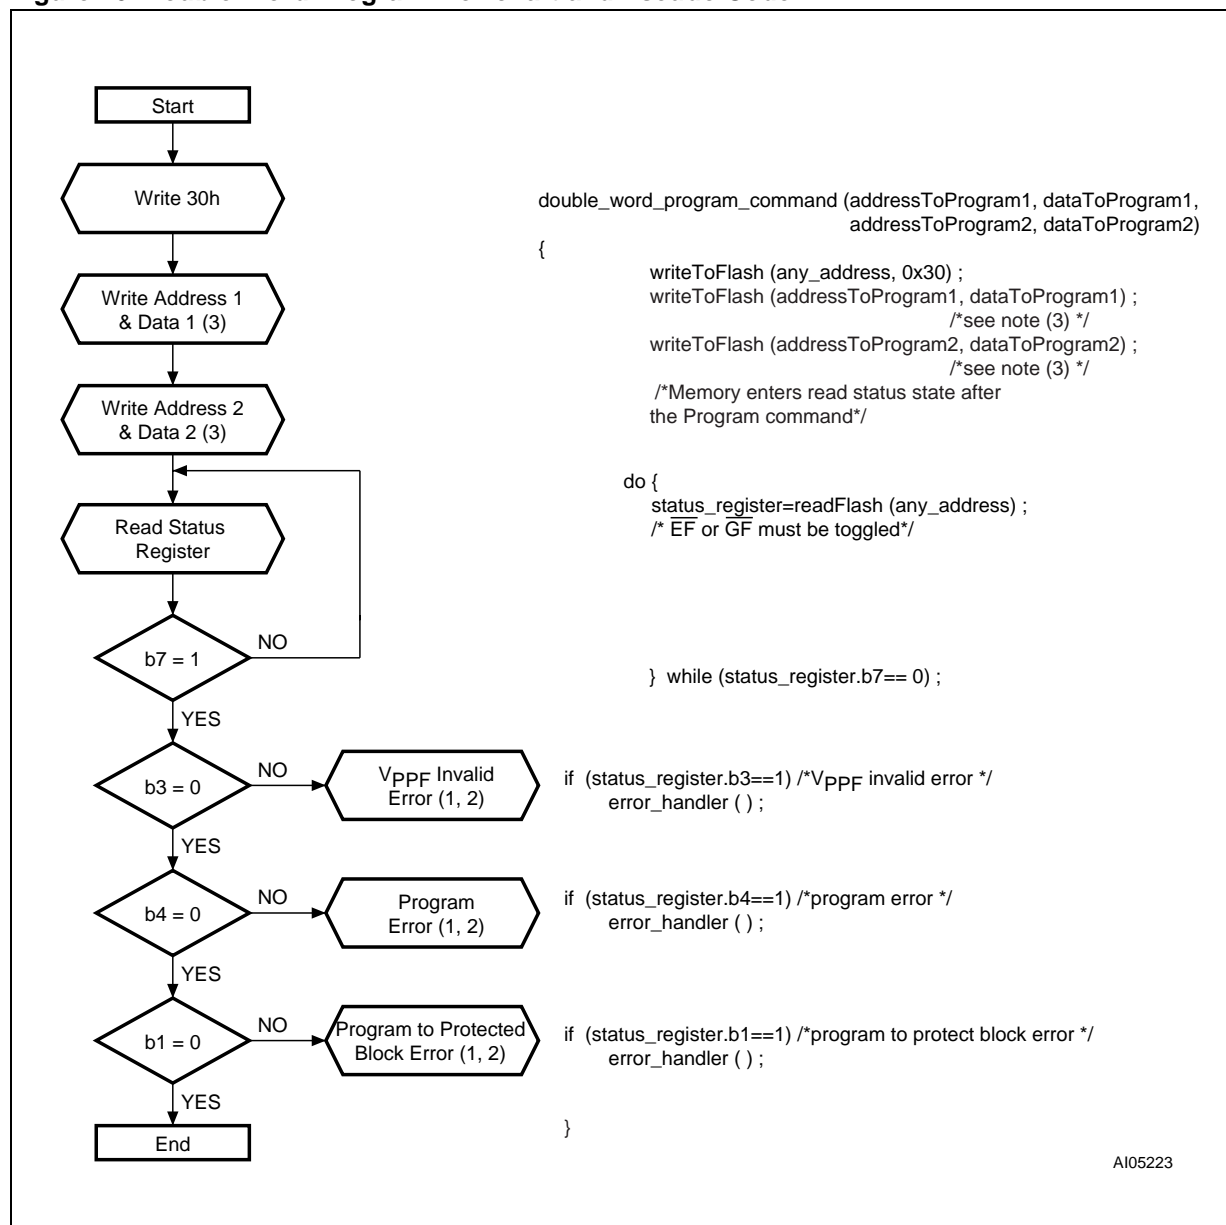

Figure 25. Program Flowchart and Pseudo Code

Note: 1. Status check of b1 (Protected Block), b3 (VppF Invalid) and b4 (Program Error) can be made after each program operation or after a sequence.

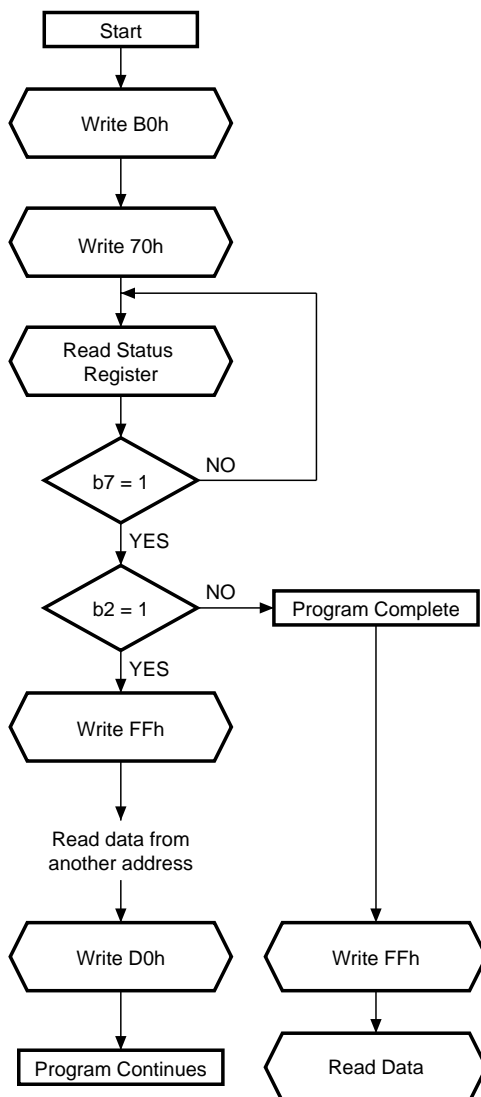

2. If an error is found, the Status Register must be cleared before further Program/Erase Controller operations.

Figure 26. Double Word Program Flowchart and Pseudo Code

- Note: 1. Status check of b1 (Protected Block), b3 (VppF Invalid) and b4 (Program Error) can be made after each program operation or after a sequence.  
 2. If an error is found, the Status Register must be cleared before further Program/Erase operations.  
 3. Address 1 and Address 2 must be consecutive addresses differing only for bit A0.

Figure 27. Program Suspend &amp; Resume Flowchart and Pseudo Code

```

program_suspend_command ( ) {
    writeToFlash (any_address, 0xB0) ;

```

```

    writeToFlash (any_address, 0x70) ;
    /* read status register to check if
    program has already completed */

```

```

do {
    status_register=readFlash (any_address) ;
    /* EF or GF must be toggled*/

```

```

} while (status_register.b7== 0) ;

```

```

if (status_register.b2==0) /*program completed */
{ writeToFlash (any_address, 0xFF) ;
  read_data ( ) ; /*read data from another block*/
  /*The device returns to Read Array
  (as if program/erase suspend was not issued).*/

```

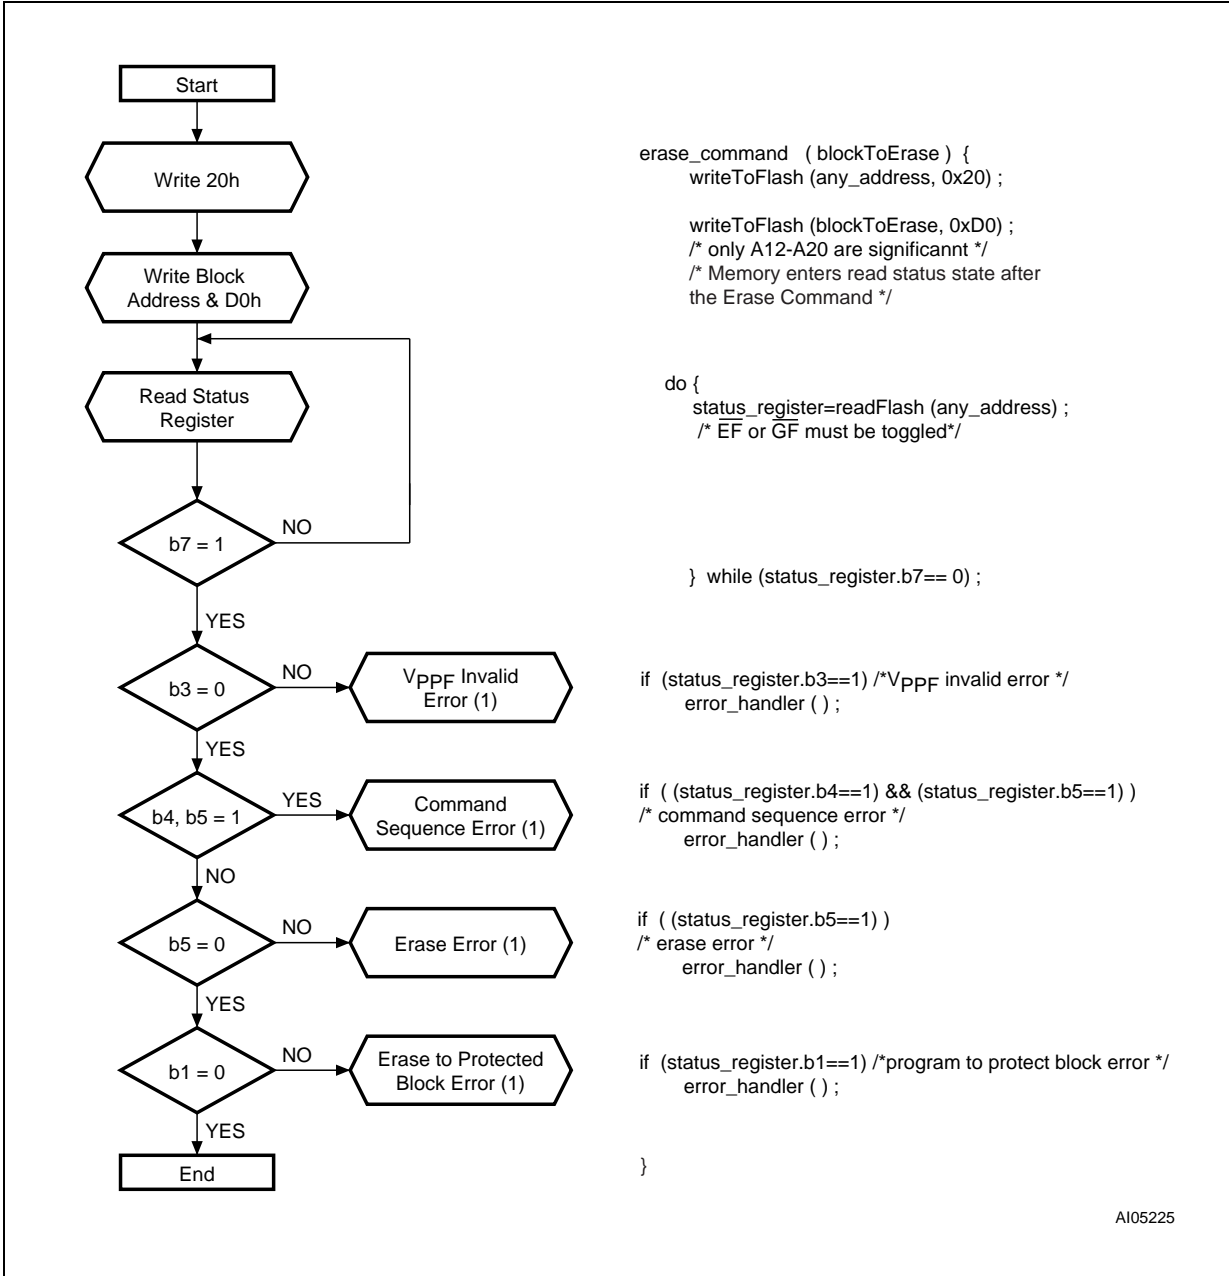

```

}
else
