DESCRIPTION

The ST890 is a low voltage, P-Channel MOSFET power switch intended for high side load switching applications.

This switch operates with inputs from 2.7V to 5.5V, making it ideal for both 3V and 5V systems. Internal current limiting circuitry protects the input supply against overload. Thermal overload

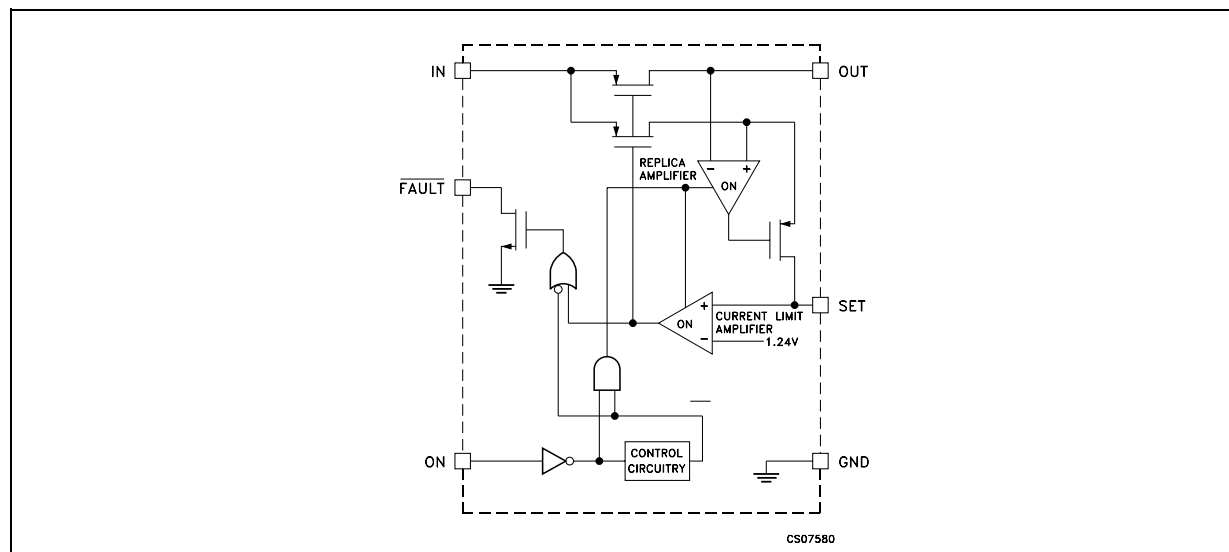

protection limits power dissipation and junction temperatures.

The ST890's maximum current limit is 1.2A. The current limit through the switch is programmed with a resistor from SET to ground. The ST890 is available in SO-8 package. Main applications are: PCMCIA slots, Access bus slots, Portable equipment.

PIN DESCRIPTION

Pin N°	Symbol	Name and Function
1, 2	\overline{IN}	Input P-Channel MOSFET source. Bypass IN with a 1 μ F capacitor to ground.
3	\overline{ON}	Active Low Switch On Input. A logic low turns the switch ON
4	GND	Ground
5	SET	Set Current Limit Input. A resistor from SET to GROUND sets the current limit for the switch. $R_{SET} = 1.38 \times 10^3 / I_{LIM}$, where I_{LIM} is the desired current limit in Amperes
6, 7	OUT	Switch Output. P-Channel MOSFET drain. Bypass OUT with a 0.1mF capacitor to GROUND.
8	\overline{FAULT}	Fault Indicator Output. This open drain output goes low when in current limit or when the die temperature exceeds 135°C
