- DIGITAL INPUTS ARE TTL LEVELS COMPATIBLE

DESCRIPTION

The STM7E1 consists in 7 identical ISDN E1 channels, each channel corresponding to 4 main low-resistant switches (a and b) and 2 auxiliary switches (c and d). The switches positions in all the channels are identical and controlled by a unique control resource driven by the digital inputs Lm, Ls and Sc.

In each channel, the TX and RX lines can be switched between a Main port or a Spare-port by the main switches: if both "a" switches are closed and both "b" switches are open, the Main port is connected to the line, while if both "a" switches are open and both "b" switches are closed, the spare port is connected to the line.

The 2 auxiliary switches enable to close a local loop between the TX and RX access of a port: if "c" is closed, the Spare port RX and TX access is connected between each other to form a local loop, while if "d" is closed, the Main port RX and TX access is connected between each other to form a local loop.

The Spare port is only used for test purpose on the system board while the Main port is the communication channel. Consequently, a switching from the Main port to the Spare port occurs very rarely (<10 times a day).

The power supplies of the chip need to be decoupled properly. This means that at least one external capacitor C1 must be connected between GND and VPOS, one external capacitor C2 between GND and VNEG, and one external capacitor C3 between each pair of VNEG and VPOS.

TYPICAL OPERATING CIRCUIT

DECODING OF FUNCTIONAL MODE 1 (MODE = L)

Main Switches	Sc low	a closed, b open	Main port is connected to the line
	Sc high	a open, b closed	Spare port is connected to the line
Auxiliary Switches	Lm low	d open	Main port local loop open
	Lm high	d closed	Main port local loop closed
	Ls low	c open	Spare port local loop open
	Ls high	c closed	Spare port local loop closed

When closing the main port local loop (Lm high), it is external system responsibility to ensure that the main port has previously been disconnected from the line (Sc has to be high). There is no internal mechanism to ensure this.

When closing the spare port local loop (Ls high), it is external system responsibility to ensure that the spare port has previously been disconnected from the line (Sc has to be high). There is no internal mechanism to ensure this.

DECODING OF FUNCTIONAL MODE 2 (MODE = H)

INPUT		OUTPUTS

L		O	C
H		C	O

C = Closed
O = Open

TEST MODE DESCRIPTION (MODE = 0, TEST = 1)

In order to test the main switches (4-point measurement), test modes are foreseen where the main switches can be controlled independently from each other. One can enter in test mode by controlling the Sc, Lm and Ls pins according to the following table.

The digital part and auxiliary switches can be tested in functional mode.

Signification	Sc	Lm	Ls
A_TX closed	H	H	L
A_RX closed	L	H	L
B_TX closed	H	L	H
B_RX closed	L	L	H
B_TX & c closed	H	L	L
A_RX & d closed	L	L	L
All main switches open	H	H	H
	L	H	H

Note 1: Although there is an internal pull down in the TEST pin, an external hardware connection from TEST to GND is required on the board to work in functional mode.

ABSOLUTE MAXIMUM RATINGS

Symbol	Description	Min	Max	Unit
V _{POS}	Positive Power Supply Voltage	V _{NEG} - 0.3	V _{NEG} + 7	V
GND	Reference Ground	V _{NEG} - 0.3	V _{NEG} + 7	V
V _{IN}	Input Voltage for Digital Inputs and Analog Input/Output Pins	V _{NEG} - 0.3	V _{NEG} + 7	V

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these condition is not implied.
