

## STMAV340

### Low ON Resistance Quad, SPDT, Wide-Bandwidth Video Switch

#### Features

- Bi-directional operation
- 4 input/output channels analog video switch
- Wide bandwidth 300MHz
- Low  $4\Omega$  switch resistance between two ports
- Excellent  $R_{ON}$  matching between channels
- Minimal propagation delay through the switch
- Low quiescent current consumption
- $V_{CC}$  Operating Range: 4.0V to 5.5V
- Zero bounce in flow-through mode
- Control inputs compatible with TTL level
- All input/output pins are on the same side facilitates PCB routing
- Data and control inputs provide the undershoot clamp diode
- Guaranteed break-before-make timing
- High ESD rating: > 2kV HBM
- $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  operating temperature range
- Suitable for both RGB and Composite-Video Switching
- Available in a small TSSOP16 package

#### Applications

- Advanced TVs
- Front projectors
- LCD Monitors
- Notebook PCs
- DVD Players

#### Description

The STMAV340 is a bidirectional quad (4 channel), high speed single pole/double throw (SPDT), low power CMOS TTL-compatible analog video switch designed for advanced video applications which demand superior image quality. The low ON Resistance ( $R_{ON}$ ) of the switch allows inputs to be connected to outputs without adding propagation delay or generating additional ground bounce noise.

STMAV340 is designed for very low cross-talk, low bit-to-bit skew, high channel-to-channel noise isolation, and low I/O capacitance. The switch offers very little or practically no attenuation of the high speed signals at the outputs, thus preserving the signal integrity enough to pass stringent requirements.

The STMAV340 is able to simplify the PCB routing on inputs and outputs as well as reduce the overall BOM costs by eliminating the need for more costly input-output controllers.

# 1 Summary Description

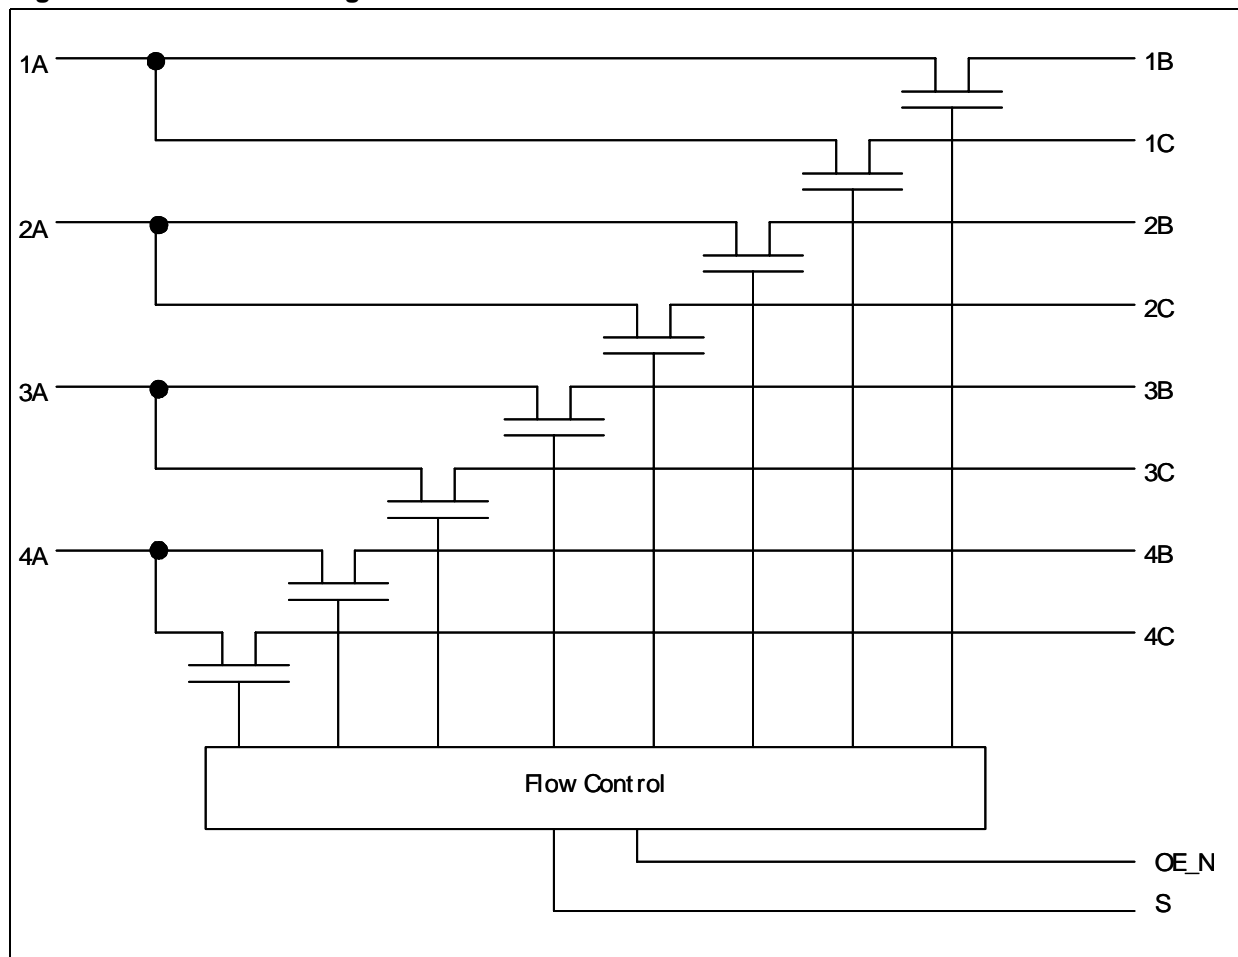

## 1.1 Functional Description

The STMAV340 is a high bandwidth, analog video switch. It is low ON-resistance and low I/O capacitance result in a very small propagation delay.

When OE\_N is set to LOW, the select (S) pin connects port A to the selected port B or port C output. When OE\_N is set to HIGH, the switch is OPEN and a high-impedance state exists between the A port and B/C ports.

Low differential gain and phase make this switch ideal for component and RGB video applications. This device has high bandwidth and low crosstalk, making it ideal for high frequency applications as well.

#### 3.1 Power Supply Sequencing

Proper power-supply sequencing is advised for all CMOS devices. Applying  $V_{CC}$  before sending any signals to the input/output or control pins is recommended.

## 4 Maximum Ratings

Stressing the device above the rating listed in the “Absolute Maximum Ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 3. Absolute Maximum Ratings**

$T_A = 25^{\circ}\text{C}$ , GND= 0V

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply Voltage to Ground	-0.5 to + 7.0	V
$V_S$	DC Switch Voltage	-0.5 to + 7.0	V
$V_{IN}$	DC Input Voltage	-0.5 to + 7.0	V
$I_{IK}$	DC Input Diode Current	-50	mA
$I_{OUT}$	DC Output Sink Current	128	mA
$I_{CC}/I_{GND}$	DC $V_{CC}$ /GND Current	$\pm 100$	mA
$T_{STG}$	Storage Temperature Range	-65 to 150	$^{\circ}\text{C}$

**Note:** Absolute maximum ratings are those values above which damage to the device may occur. Functional operation under these conditions is not implied. All voltages are referenced to GND.

**Figure 8. Turn-on/Turn-off Test Circuit and Timing Diagram**

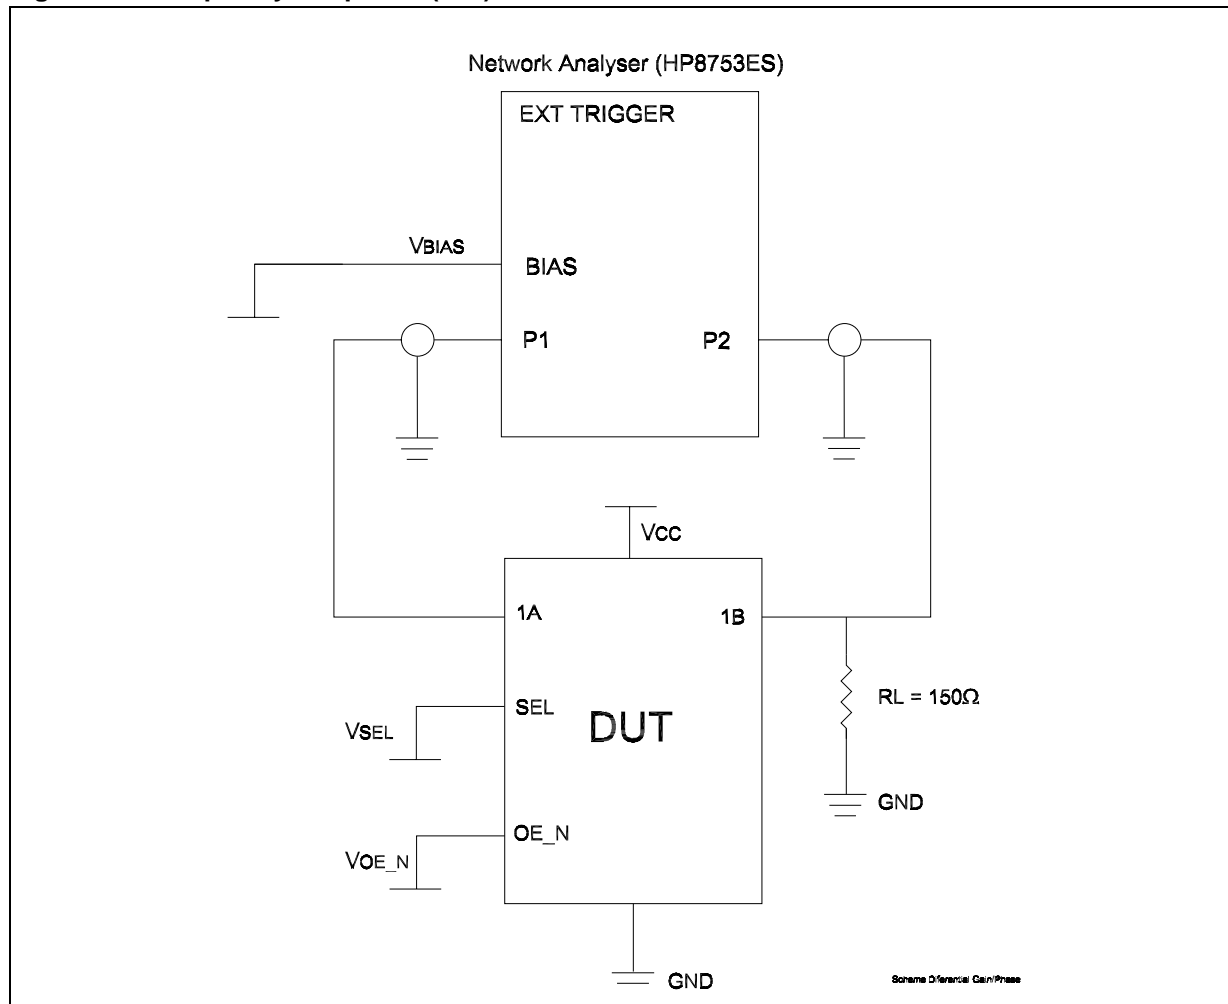

Differential gain and phase are measured at the output of the ON channel. For example, when  $V_{SEL} = 0$ ,  $V_{OE\_N} = 0$  and 1A is the input, the output is measured at 1B.

**Figure 9. Differential Gain/Phase Measurement Test Circuit**

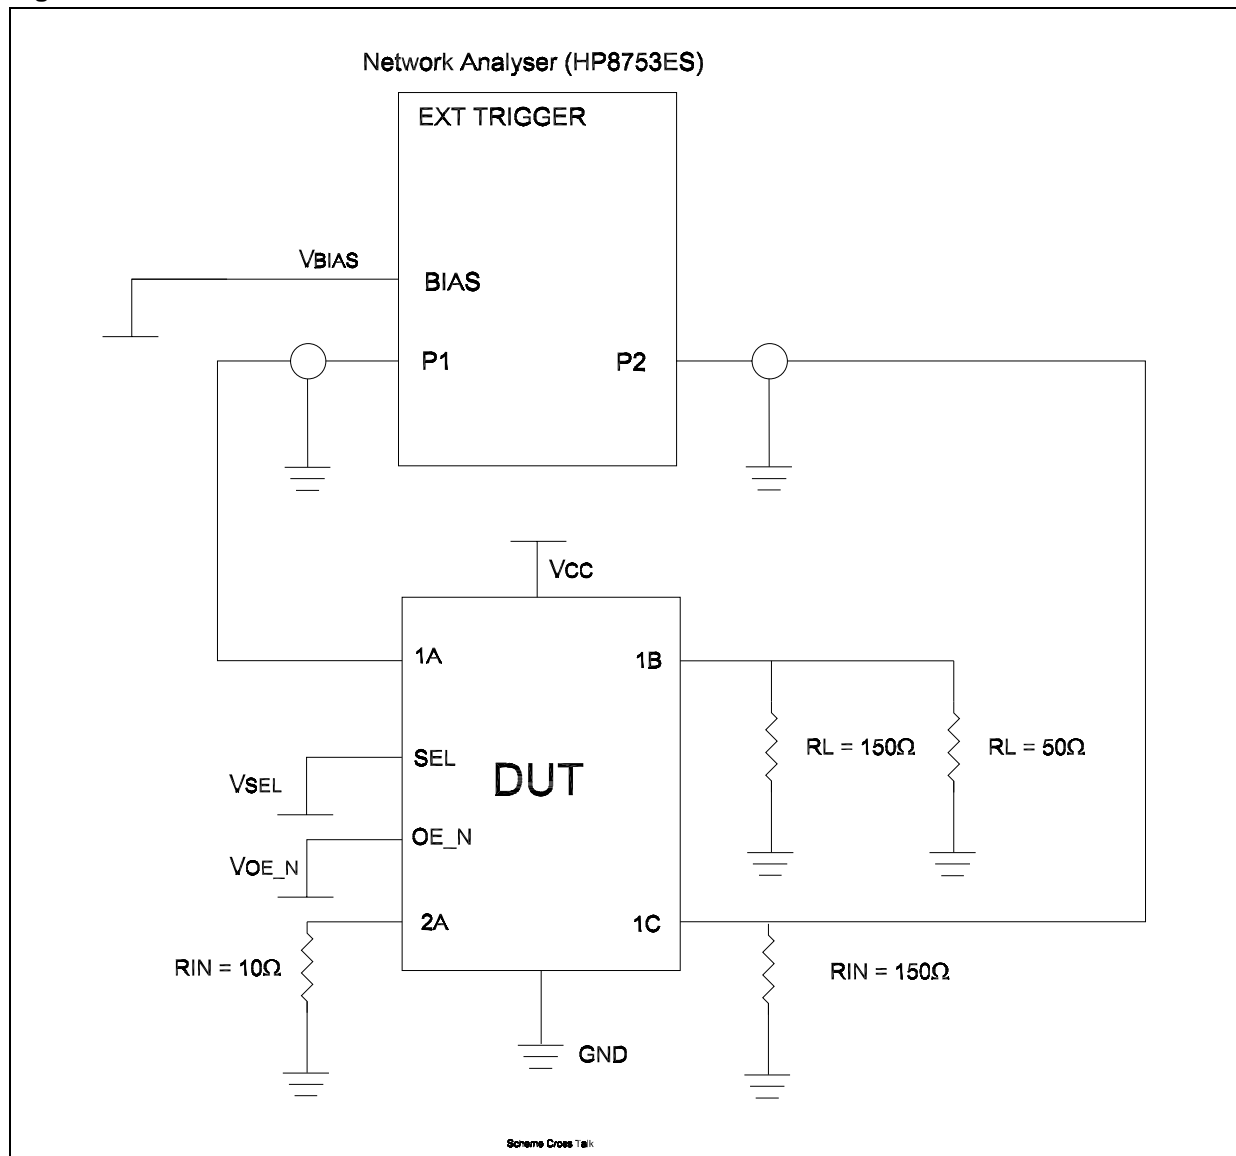

Frequency response is measured at the output of the ON channel. For example, when  $V_{SEL} = 0$ ,  $V_{OE\_N} = 0$  and 1A is the input, the output is measured at 1B. All unused analog I/O ports are left open.

**Figure 10. Frequency Response (BW) Test Circuit**

A  $50\Omega$  termination resistor is needed for the network analyzer. Crosstalk is measured at the output of the non-adjacent ON channel. For example,  $V_{SEL} = 0$ ,  $V_{OE\_N} = 0$ , and 1A is the input, the output is measured at 1C. All unused analog input ports are connected to GND through IO-ports and the output ports are connected to GND through the  $50\Omega$  pull down resistors.

**Figure 11. Crosstalk Test Circuit**

A  $50\Omega$  termination resistor is needed for the network analyzer. Off-isolation is measured at the output of the OFF channel. For example, when  $V_{SEL} = V_{CC}$ ,  $V_{OE\_N} = 0$  and 1A is the input, the output is measured at 1B. All unused analog input ports are left open, and the output ports are connected to GND through the  $50\Omega$  pulldown resistors.

## 7 Package Mechanical Data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect . The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).
