PLASMA DISPLAY PANEL SCAN DRIVER

FEATURE

- 64/65 SELECTABLE OUTPUT PLASMA DISPLAY DRIVER
- 100 V ABSOLUTE MAXIMUM SUPPLY
- 5 V SUPPLY FOR LOGIC
- 100/850 mA SOURCE/SINK OUTPUT
- 700 mA SOURCE/SINK OUTPUT DIODE
- 65-bit BIDIRECTIONAL SHIFT REGISTER (8 MHz)
- HIGH IMPEDANCE OUTPUT CONTROL
- BCD TECHNOLOGY
- 100-PIN TQFP PACKAGE WITH INTEGRATED HEATSINK

DESCRIPTION

The STV7617 is a scan driver for Plasma Display Panel (PDP) implemented in ST's proprietary BCD technology. Using a 65-bit cascable 8 MHz shift register, it drives 65 high current & high voltage outputs. The STV7617 can be configured either in 64 or 65 outputs depending on the SEL input Pin.

By serially connecting several STV7617, any vertical pixel definition can be performed. The STV7617 is supplied with a separated 90V power output supply and a 5 V logic supply. All command inputs are CMOS compatible. The STV7617 package is a 100-pin TQFP with integrated heatsink located on the bottom (STV7617D) or top (STV7617U) of the package. It is also available without heatsink (STV7617).

BLOCK DIAGRAM

CIRCUIT DESCRIPTION

The STV7617 contains all the logic and the power circuits necessary to drive rows of a Plasma Display Panel (PDP). Data is shifted at each low to high transition of the (CLK) shift clock. After 64 or 65 shifts (depending on SEL) the first bit presented at (SIN) is available at the serial output (SOUT). This output can be used to cascade several drivers to perform any vertical resolution. CLK, STB, SIN and SOUT inputs are Smith trigger inputs. BLK and HIZ logical inputs are internally pulled to level "1". The maximum frequency of the shift clock is 8 MHz.

Shift register outputs (P1, ... P65) are transferred from the shift register into the latch stage when the latch input (STB) is at low level.

Table 1 : Output State Configuration

STB	BLK	HIZ	Output State
*	L	L	High impedance
L	L	H	Inverted copy of input data
H	L	H	Data latched
*	H	L	Low level
*	H	H	High Level

Sustain current must not be sunk in the power outputs to VPP when the power supply is applied and output state is in HIZ or at high state. VSSSUB and VSSLOG must be connected as close as possible to the logical reference ground of the application.

Table 2 : Shift Register Truth Table

F/R	CLK	SIN	SOUT	Comments
H	Rise	In	Out	Forward Shift
H	L or H	In	Out	Steady
L	Rise	Out	In	Reverse Shift
L	L or H	Out	In	Steady

Table 3 : Power Output Configuration

SEL	F/R	Number of Outputs	Comments
L	L	64	Out 1 is in Hi-Z mode (outputs 65 to 2 powered)
L	H	64	Out 65 is in Hi-Z mode (outputs 1 to 64 powered)
H	L	65	Out 65 to Out 1 powered
H	H	65	Out 1 to Out 65 powered
