

CDC921

133-MHz CLOCK SYNTHESIZER/DRIVER FOR PC MOTHERBOARDS WITH 3-STATE OUTPUTS

SCAS623 –MAY 27, 1999

- **Generates Clocks for Pentium™ III Class Microprocessors**
- **Supports a Single Pentium III Microprocessor**
- **Uses a 14.318 MHz Crystal Input to Generate Multiple Output Frequencies**
- **Includes Spread Spectrum Clocking (SSC), 0.5% Downspread for Reduced EMI Performance**
- **Power Management Control Terminals**
- **Low Output Skew and Jitter for Clock Distribution**
- **Operates from Dual 2.5-V and 3.3-V Supplies**
- **Generates the Following Clocks:**
 - 3 CPU (2.5 V, 100/133 MHz)
 - 10 PCI (3.3 V, 33.3 MHz)
 - 1 CPU/2 (2.5 V, 50/66 MHz)
 - 1 APIC (2.5 V, 16.67 MHz)
 - 3 3V66 (3.3 V, 66 MHz)
 - 2 REF (3.3 V, 14.318 MHz)
 - 1 48MHz (3.3 V, 48 MHz)
- **Packaged in 48-Pin SSOP Package**
- **Designed for Use with TI's Direct Rambus™ Clock Generators (CDCR81, CDCR82, CDCR83)**

**DL PACKAGE

description

The CDC921 is a clock synthesizer/driver that generates CPU, CPU_DIV2, 3V66, PCI, APIC, 48MHz, and REF system clock signals to support computer systems with a single Pentium III class microprocessor.

All output frequencies are generated from a 14.318-MHz crystal input. Instead of a crystal, a reference clock input can be provided at the XIN input. Two phase-locked loops (PLLs) are used to generate the host frequencies and the 48-MHz clock frequency. On-chip loop filters and internal feedback eliminate the need for external components.

The host and PCI clock outputs provide low-skew and low-jitter clock signals for reliable clock operation. All outputs have 3-state capability, which can be selected via control inputs SEL0, SEL1, and SEL133/100.

The 48MHz clock can be independently disabled via the control inputs SEL0, SEL1, and SEL133/100. In this state, the 48-MHz PLL is disabled and the 48MHz clock is driven to high impedance to reduce component jitter.

The outputs are either 3.3-V or 2.5-V single-ended CMOS buffers. With a logic high-level on the PWR_DWN terminal, the device operates normally, but when a logical low-level input is applied, the device powers down completely with the outputs in a low-level output state.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

CDC921

133-MHz CLOCK SYNTHESIZER/DRIVER FOR PC MOTHERBOARDS

WITH 3-STATE OUTPUTS

SCAS623 –MAY 27, 1999

description (continued)

The CPU bus can operate at 100 MHz or 133 MHz. Output frequency selection is done with corresponding setting for SEL133/100 control input. The PCI bus frequency is fixed to 33 MHz.

Since the CDC921 is based on PLL circuitry, it requires a stabilization time to achieve phase lock of the PLL. This stabilization time is required after power up or after changes to the SEL inputs are made. With use of an external reference clock, this signal must be fixed-frequency and fixed-phase before the stabilization time starts.

Function Tables

WITH 3-STATE OUTPUTS

SCAS623 –MAY 27, 1999

spread spectrum clock (SSC) implementation for CDC921

Simultaneously switching at fixed frequency generates a significant power peak at the selected frequency, which in turn will cause EMI disturbance to the environment. The purpose of the internal frequency modulation of the CPU-PLL allows to distribute the energy to many different frequencies which reduces the power peak. A typical characteristic for a single frequency spectrum and a frequency modulated spectrum is shown in Figure 1.

Figure 1. Frequency Power Spectrum With and Without the Use of SSC

The modulated spectrum has its distribution left hand to the single frequency spectrum which indicates a “down-spread modulation”.

The peak reduction depends on the modulation scheme and modulation profile. System performance and timing requirements are the limiting factors for actual design implementations. The implementation was driven to keep the average clock frequency closed to its upper specification limit. The modulation amount was set to approximately -0.5% .

In order to allow a downstream PLL to follow the frequency modulated signal, the bandwidth of the modulation signal is limited in order to minimize SSC induced tracking skew jitter. The ideal modulation profile used for CDC921 is shown in Figure 2.

Figure 2. SSC Modulation Profile

SCAS623 –MAY 27, 1999

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)[†]

Supply voltage range, V_{DD}	–0.5 V to 4.6 V
Input voltage range, V_I (see Note 1)	–0.5 V to 4.6 V
Voltage range applied to any output in the high-impedance state or power-off state, V_O (see Note 1)	–0.5 V to $V_{DD} + 0.5$ V
Current into any output in the low state, I_O	$2 \times I_{OL}$
Input clamp current, I_{IK} ($V_I < 0$)	–18 mA
Output clamp current, I_{OK} ($V_O < 0$)	–50 mA
Operating free-air temperature range, T_A	–0°C to 85°C
Storage temperature range, T_{stg}	–65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

DISSIPATION RATING TABLE

PACKAGE	$T_A \leq 25^\circ\text{C}$ POWER RATNG	DERATING FACTORT ABOVE $T_A = 25^\circ\text{C}$	$T_A = 70^\circ\text{C}$ POWER RATING	$T_A = 85^\circ\text{C}$ POWER RATING
DL	1315.7 mW	10.53 mW/°C	842.1 mW	684.2 mW

[†] This is the inverse of the traditional junction-to-case thermal resistance ($R_{\theta JA}$) and uses a board-mounted device at 95°C/W.

recommended operating conditions (see Note 2)

		MIN	NOM [†]	MAX	UNIT
Supply voltage, V_{DD}	3.3 V	3.135		3.465	V
	2.5 V	2.375		2.625	
High-level input voltage, V_{IH}		2		$V_{DD} + 0.3$ V	V
Low-level input voltage, V_{IL}		GND – 0.3 V		0.8	V

	48MHz, REFx			9	
	PCIx, PCI_F, 3V66x			12	
Reference frequency, $f_{(XTAL)}$ [‡]	Test mode		130		MHz
Crystal frequency, $f_{(XTAL)}$ [§]	Normal mode	13.8	14.318	14.8	MHz
Operating free-air temperature, T_A		0		85	°C

NOTE 2: Unused inputs must be held high or low to prevent them from floating.

[†] All nominal values are measured at their respective nominal V_{DD} values.

[‡] Reference frequency is a test clock driven on the XIN input during the device test mode and normal mode. In test mode, XIN can be driven externally up to $f_{(XTAL)} = 130$ MHz. If XIN is driven externally, XOUT is floating.

[§] This is a series fundamental crystal with $f_O = 14.31818$ MHz.

t _{dis3} Disable time, PWR_DWN to PC1x	f(CPU) = 133 MHz		50		ns
Stabilization time, PWR_DWN to CPUx	f(CPU) = 133 MHz		0.03	3	ms
t _{dis4} Disable time, PWR_DWN to CPUx	f(CPU) = 133 MHz		50		ns
Stabilization time†	After SEL1, SEL0			3	ms
	After power up			3	

† Stabilization time is the time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal. In order for phase lock to be obtained, a fixed-frequency, fixed-phase reference signal must be present at X1. Until phase lock is obtained, the specifications for propagation delay and skew parameters given in the switching characteristics tables are not applicable. Stabilization time is defined as the time from when V_{DD} achieves its nominal operating level until the output frequency is stable and operating within specification.

LOAD CIRCUIT for t_{pd} and t_{sk}

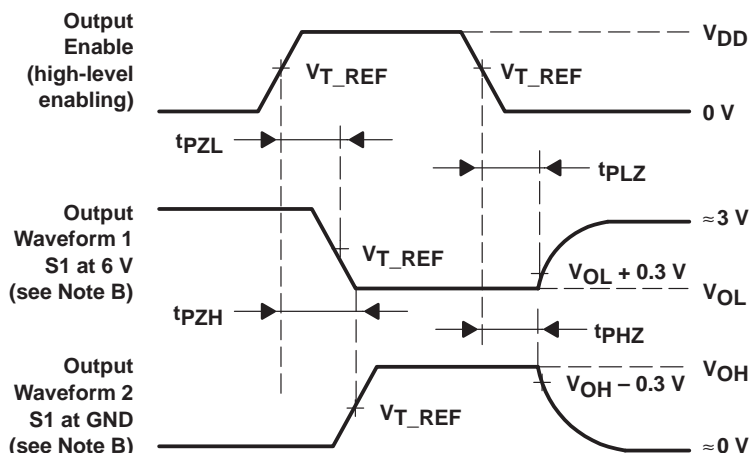

LOAD CIRCUIT FOR t_r and t_f

VOLTAGE WAVEFORMS

VOLTAGE WAVEFORMS

VOLTAGE WAVEFORMS

- NOTES: A. C_L includes probe and jig capacitance. $C_L = 20$ pF (CPUx, APIC, 48MHz, REF), $C_L = 30$ pF (PCIx)
- B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: $PRR \leq 14.318$ MHz, $Z_O = 50 \Omega$, $t_r \leq 2.5$ ns, $t_f \leq 2.5$ ns.
- D. The outputs are measured one at a time with one transition per measurement.

PARAMETER	3.3-V INTERFACE	2.5-V INTERFACE	UNIT
V_{IH_REF} High-level reference voltage	2.4	2	V
V_{IL_REF} Low-level reference voltage	0.4	0.4	V
V_{T_REF} Input Threshold reference voltage	1.5	1.25	V
V_{O_REF} Off-state reference voltage	6	4.6	V

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
