### description

This 16-bit registered transceiver is designed for 1.65-V to 3.6-V  $V_{CC}$  operation.

The SN74LVCH16952A contains two sets of D-type flip-flops for temporary storage of data flowing in either direction. It can be used as two 8-bit transceivers or one 16-bit transceiver. Data on the A or B bus is stored in the registers on the low-to-high transition of the clock (CLKAB or CLKBA) input, provided that the clock-enable (CEAB or CEBA) input is low. Taking the output-enable ( $\overline{OEAB}$  or  $\overline{OEBA}$ ) input low accesses the data on either port.

To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Inputs can be driven from either 3.3-V or 5-V devices. This feature allows the use of these devices as translators in a mixed 3.3-V/5-V system environment.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

The SN74LVCH16952A is characterized for operation from  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ .
