

TOSHIBA BIPOLAR LINEAR INTEGRATED CIRCUIT SILICON MONOLITHIC

TA7368P, TA7368F

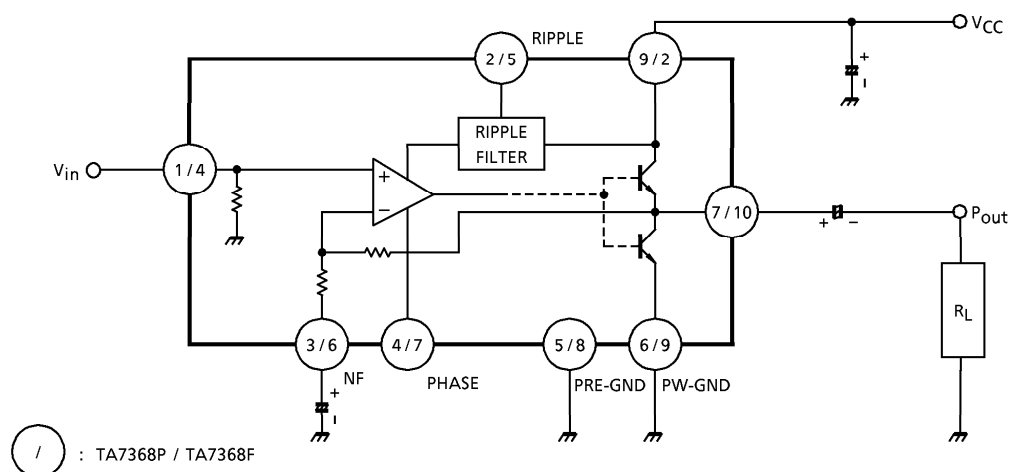

AUDIO POWER AMPLIFIER

The TA7368P and TA7368F are suitable for the audio power amplifier of portable cassette tape recorder and radio.

FEATURES

- Very few external parts (Only three capacitors)
- Low quiescent current : $I_{CCQ} = 6.6\text{mA}$ (Typ.) ($V_{CC} = 6\text{V}$)
- Output Power
 TA7368P
 : $P_{out} = 720\text{mW}$ (Typ.) ($V_{CC} = 6\text{V}$, $R_L = 4\Omega$, THD = 10%)
 TA7368P / F
 : $P_{out} = 450\text{mW}$ (Typ.) ($V_{CC} = 6\text{V}$, $R_L = 8\Omega$, THD = 10%)
- Voltage gain : $G_V = 40\text{dB}$ (Typ.)
- Operating supply voltage range : $V_{CC} = 2 \sim 10\text{V}$ ($T_a = 25^\circ\text{C}$)

● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

PRECAUTION FOR USE AND APPLICATION

1. Input stage

The input stage of power amplifier (Equivalent circuit) is comprised of a PNP differential pair (Q_2 and Q_3) preceded by a PNP emitter follower (Q_1) which allows DC referencing of the source signal to ground. This eliminated the need for an input coupling capacitor. However, in case the brush noise of volume becomes a problem, provide serially a coupling capacitor to the input side.

2. Adjustment of voltage gain

The voltage gain is fixed at $G_V \cong 40\text{dB}$ by the resistors (R_4 and R_5) in IC, however, its reduction is possible through adding R_f as shown in Figure 2. In this case, the voltage gain is obtained by the following equation.

$$G_V = 20 \log \frac{R_5 + R_4 + R_f}{R_4 + R_f}$$

It is recommended to use this IC with the voltage gain of $G_V = 28\text{dB}$ or over.

3. Ripple rejection ratio

Adding C_{RIP} to ripple terminal 2 as shown in Figure 3, the ripple rejection ratio is improved from -25dB Typ. to -45dB Typ.

4. Power dissipation

Care should be taken to use this IC below maximum power dissipation. Because it may over maximum rating depending on operating condition.

- TA7368P $P_D = 900\text{mW}$ ($T_a = 25^\circ\text{C}$)
- TA7368F $P_D = 400\text{mW}$ ($T_a = 25^\circ\text{C}$)

5. Phase-compensation

Small temperature coefficient and excellent frequency characteristic is needed by capacitors below.

- Oscillation preventing capacitors for power amplifier output
- Bypass capacitor for ripple filter
- Capacitor between V_{CC} and GND
