## VIDEO, CHROMA AND SYNCHRONIZING SIGNALS PROCESSING IC FOR PAL / NTSC SYSTEM COLOR TV

TB1229DN that is a signal processing IC for the PAL / NTSC color TV system integrates video, chroma and synchronizing signal processing circuits together in a 56-pin shrink DIP plastic package.

TB1229DN incorporates a high performance picture quality compensation circuit in the video section, an automatic PAL/NTSC discrimination circuit in the chroma section, and an automatic 50/60Hz discrimination circuit in the synchronizing section. Besides a crystal oscillator that internally generates 4.43MHz, 3.58MHz and M/N-PAL clock signals for color demodulation, there is a horizontal PLL circuit built in the IC.

The PAL demodulation circuit which is an adjustment-free circuit incorporates a 1H DL circuit inside for operating the base band signal processing system.

Also, TB1229DN makes it possible to set or control various functions through the built-in I<sup>2</sup>C bus line.

 (4) Measure phase shift of B-Y color difference output of pin 36.  
 (5) While shifting color phase (tint) from minimum to maximum by the bus control, measure phase change of B-Y color difference output of pin 36. On the condition that 6 bars in the center have the peak level (regarded as center of color phase), the side of 5 bars is regarded as positive direction while the side of 7 bars is regarded as negative direction when the 5 bars or the 7 bars are in the peak level. Based on this assumption, open angle toward the positive direction is expressed as  $\Delta\theta_1$  and that toward the negative direction is expressed as  $\Delta\theta_2$  as viewed from the phase center.  $\Delta\theta_1$  and  $\Delta\theta_2$  show the tint control sharing range.

MEASURING METHOD

(1) Input stepping signal whose amplitude is 0.3V in video period to pin 31 (Y IN) and pin 51 (Sync IN).

(2) Set bus data so that blanking is off and half-tone is -3dB in on status.

(3) Connect power supply to pin 21 (Digital Ys). While impressing 0V to it, measure amplitude and pedestal level of pin 13 (G OUT) in video period (Vm13, Vp13).

(4) Raising supply voltage to pin 21 gradually from 0V, measure level (Vtht1) of pin 21 when amplitude of pin 13 output signal changes. At the same time, measure amplitude and pedestal level of pin 13 in video period after the pin 13 output signal changed in amplitude. (Vm13b, Vp13b)

(5) According to results of the above steps 3 and 4, calculate gain of -3dB half-tone and variation of pedestal level.  
G3ht13 = 20log (Vm13b / Vm13)

(6) Set bus data so that half-tone is -6dB in on status, and perform the same measurement as the above steps 4 and 5 to find gain of -6dB half-tone and variation of pedestal level (G6th13).

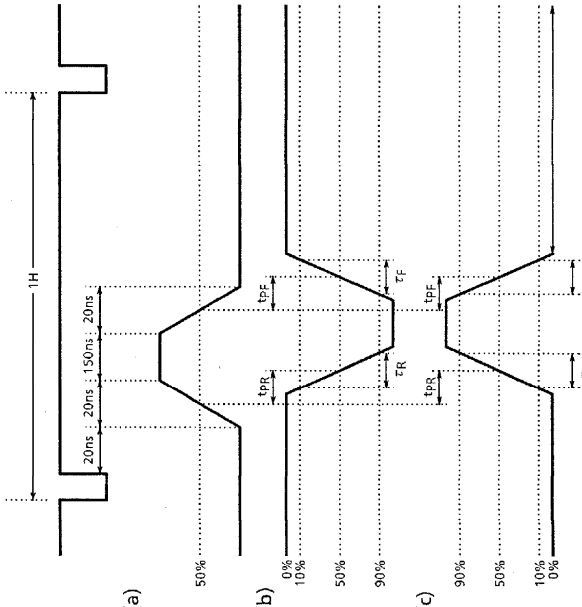

(7) Raising supply voltage to pin 21 further from Vtht1, measure level (Vtx1) of pin 21 when output signal of pin 13 (G OUT) changes in amplitude and DC level of pin 13 after the change of its output (Vtx13).

(8) From results of the above steps 3 and 7, calculate low level of the output in the text mode.  
Vtx13 = Vtx13 - Vp13

(9) Raising supply voltage to pin 21 by 3V from that in the above step 7, confirm that there is no change in output level of pin 13.

(3) Change bus data on the audio switch from TV to EXT. mode and input 1kHz, 500mV <sub>rms</sub> signal to pin 27 (TV Audio IN). In this condition measure output level of pin 29 (Audio OUT) to find ratio of this output to the output level measured in the above step 2. (Crext) (Note) For measuring signal level, use 1kHz band pass filter.	
A8	Attenuator Max. Input Voltage	A ↓ B	B ↓ A	↑	↑	40H	(1) Input 1kHz signal to pin 27 (TV Audio IN). (2) Set bus data so that the audio switch is set at TV mode and ATT gain is set at center value (40). (3) While increasing amplitude of the signal, measure input amplitude just before output waveform of pin 29 (Audio OUT) is distorted (Ditv). (4) Set bus data on the audio switch to EXT mode. While inputting 1kHz signal to pin 28 (Ext. Audio IN), perform the same measurement as the above step 3. (DlEXT).	
A9	A-SW Switching Offset	B	B	B	40H ↓ C0H	7FH	(1) Short circuit pin 27 (TV Audio IN) and pin 28 (Ext. Audio IN) in AC coupling. (2) Changing bus data on the audio switch from TV mode to EXT. mode, measure change in DC level of output signal of pin 29 (Audio OUT) at that time (VSWof).	
A10	Attenuator Breaking Frequency	A ↓ B	B ↓ A	↑	↑	↑	(1) Input 500mV <sub>rms</sub> signal to pin 27 (TV Audio IN). (2) Set bus data on the audio switch to TV mode. (3) While increasing the signal frequency from 1kHz, measure frequency when amplitude of pin 29 output (Audio OUT) is -3dB as low as the amplitude at 1kHz frequency (fctv). (4) Set bus data on the audio switch to EXT mode. While inputting 500mV <sub>rms</sub> signal to pin 28 (Ext. Audio IN), perform the same measurement as the above step 3. (fext)	
A11	Audio S/N Ratio	↑	↑	↑	40H ↓ 0CH	↑	(1) Input 500mV <sub>rms</sub> signal to pin 27 (TV Audio IN). (2) Set bus data on the audio switch to TV mode and measure output level of pin 29 (Audio OUT) (Vs). (3) Short circuit pin 27 in AC coupling and measure noise level at pin 29 (Vn). (S/Ntv = 20log (Vs/Vn)) (4) Change the setting of bus data on the audio switch to EXT. mode and change the 500mV <sub>rms</sub> input from pin 27 to pin 28. Perform the same measurement as the above step 3. (SNext) (Note) For measuring output level, use 15kHz low pass filter.

A12	Attenuator Max. Output Voltage	↑	↑	↑			(1) Input 1kHz signal to pin 27 (TV Audio IN). (2) Set bus data so that the audio switch is set to TV mode and ATT gain is maximum (7F). (3) While increasing the signal amplitude, measure output amplitude just before output signal of pin 29 (Audio OUT) is distorted. (DO1v) (4) Set bus data so that the audio switch is set to EXT. mode and ATT gain is maximum (7F). While inputting 1kHz signal to pin 28 (Ext.
