

524,288 WORD X 8 BIT DYNAMIC RAM

DESCRIPTION

The TC514800AJ/AZ/AFT is the new generation dynamic RAM organized 524,288 word by 8 bit. The TC514800AJ/AZ/AFT utilizes Toshiba's CMOS silicon gate process technology as well as advanced circuit techniques to provide wide operating margins, both internally and to the system user. Multiplexed address inputs permit the TC514800AJ/AZ/AFT to be packaged in a standard 28 pin plastic SOJ, 28 pin plastic ZIP and 28 pin plastic TSOP. The package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment. System oriented features include single power supply of $5V \pm 10\%$ tolerance, direct interfacing capability with high performance logic families such as Schottky TTL.

FEATURES

- 524,288 word by 8 bit organization
- Fast access time and cycle time
- Single power supply of $5V \pm 10\%$ with a built-in V_{BB} generator
- Low Power
 - 578mW MAX. Operating (TC514800AJ/AZ/AFT-70)
 - 495mW Max. Operating TC514800AJ/AZ/AFT-80
 - 5.5mW Max. Standby
- Outputs unlatched at cycle end allows two-dimensional chip selection
- Read-Modify-Write, \overline{CAS} before RAS refresh, RAS -only refresh, Hidden refresh, Fast Page Mode capability
- All inputs and outputs TTL compatible
- 1024 refresh cycles/16ms
- Package
 - TC514800AJ :SOJ28-P-400
 - TC514800AZ :ZIP28-P-400
 - TC514800AFT :TSOP28-P-400

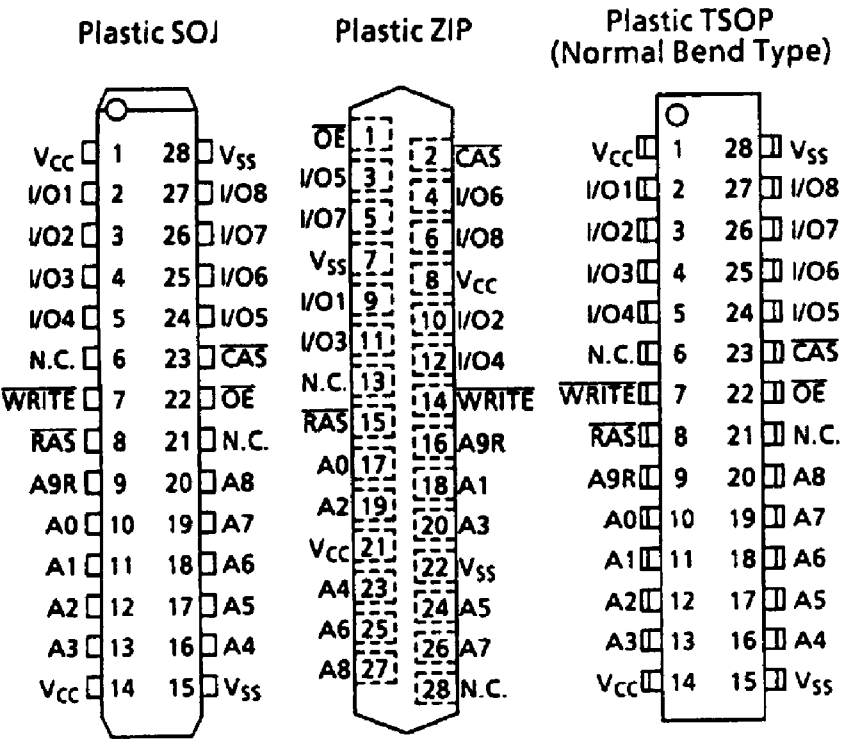

KEY PARAMETERS

ITEM	TC514800AJ/AZ/AFT	
	-70	-80
t_{RAC} \overline{RAS} Access Time	70ns	80ns
t_{AA} Column Address Access Time	35ns	40ns
t_{CAC} \overline{CAS} Access Time	20ns	20ns
t_{RC} Cycle Time	130ns	150ns
t_{PC} Fast Page Mode Cycle Time	45ns	50ns

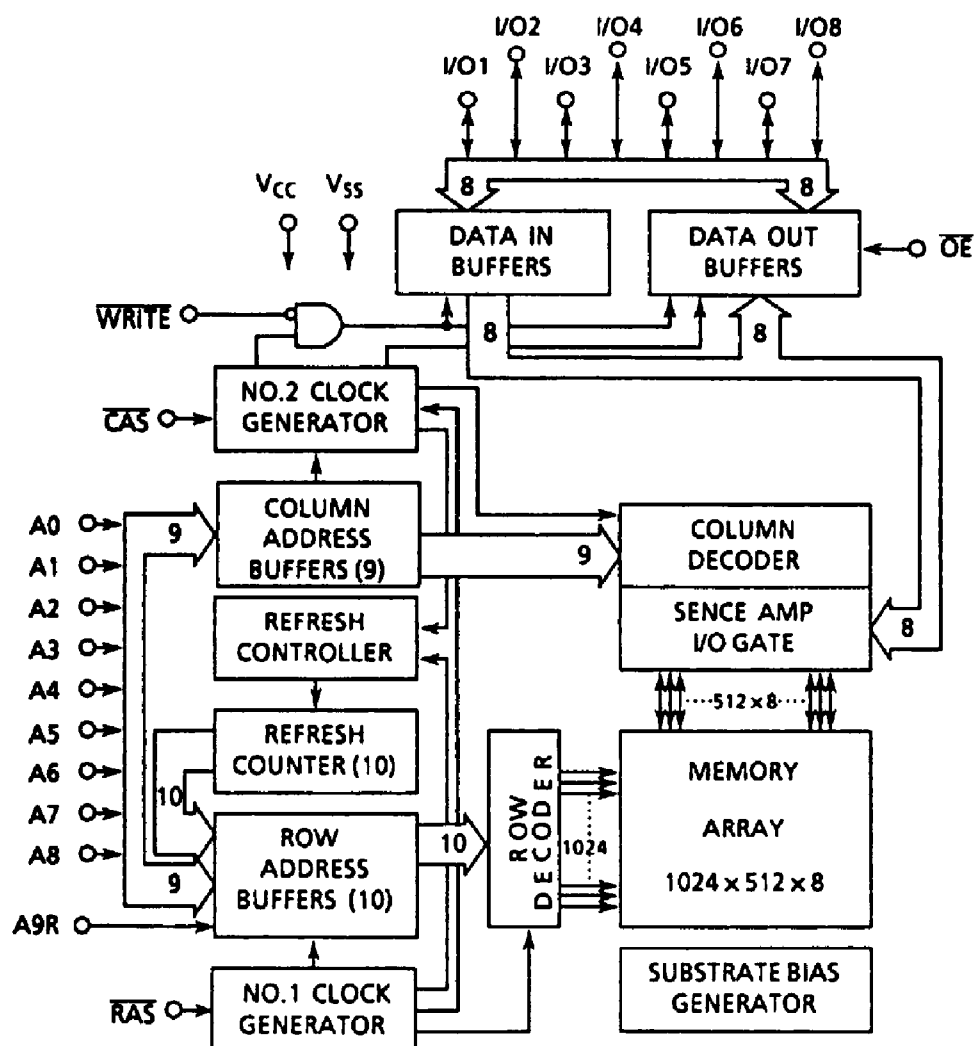

PIN NAME

A0~A8 A9R	Address Inputs
RAS	Row Address Strobe
CAS	Column Address Strobe
WRITE	Read/Write Input
OE	Output Enable
I/O1~I/O8	Data Input/Output
V _{CC}	Power (+ 5V)
V _{SS}	Ground
N.C.	No Connection

PIN CONNECTION (TOP VIEW)

CAPACITANCE ($V_{CC} = 5V \pm 10\%$, $f = 1MHz$, $T_a = 0 \sim 70^\circ C$)

SYMBOL	PARAMETER	MIN	MAX	UNIT
C_{I1}	Input Capacitance (A0~A8, A9)	-	5	pF
C_{I2}	Input Capacitance (\overline{RAS} , \overline{CAS} , \overline{WRITE} , \overline{OE})	-	7	pF
C_O	Input Capacitance (I/O1~I/O8)	-	7	pF

NOTES:

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.
2. All voltages are referenced to V_{SS} .
3. I_{CC1} , I_{CC3} , I_{CC4} , I_{CC6} depend on cycle rate.
4. I_{CC1} , I_{CC4} depend on output loading. Specified values are obtained with the output open.
5. Address can be changed one or less while $\overline{RAS}=V_{IL}$. In case of I_{CC4} , it can be changed once or less during a fast page mode cycle (t_{PC}).
6. An initial pause of 200 μ s is required after power-up followed by 8 \overline{RAS} only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 \overline{CAS} before \overline{RAS} refresh cycles instead of 8 \overline{RAS} only refresh cycles are required.
7. AC measurements assume $t_T=5$ ns.
8. V_{IH} (min.) and V_{IL} (max.) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
9. Measured with a load equivalent to 2 TTL loads and 100pF.
10. t_{OFF} (max.) and t_{OEZ} (max.) define the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.
11. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
12. These parameters are referenced to \overline{CAS} leading edge in early write cycles and to \overline{WRITE} leading edge in Read-Modify-Write cycles.
13. t_{WCS} , t_{RWD} , t_{CWD} , t_{AWD} and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$ (min.), the cycle is an early write cycle and the data output will remain open circuit (high impedance) through the entire cycle; If $t_{RWD} \geq t_{RWD}$ (min.), $t_{CWD} \geq t_{CWD}$ (min.), $t_{AWD} \geq t_{AWD}$ (min.) and $t_{CPWD} \geq t_{CPWD}$ (min.), (Fast Page Mode), the cycle is a Read-Modify-Write cycle and the data out will contain data read from the selected cell; If neither of the above sets of condition is satisfied, the condition of the data out (at access time) is indeterminate.
14. Operation within the t_{RCD} (max.) limit insures that t_{RAC} can be met. t_{RCD} (max.) is specified as a reference point only: If t_{RCD} is greater than the specified t_{RCD} (max.) limit, then access time is controlled by t_{CAC} .
15. Operation within the t_{RAD} (max.) limit insures that t_{RAC} (max.) can be met. t_{RAD} (max.) is specified as a reference point only: If t_{RAD} is greater than the specified t_{RAD} (max.) limit, then access time is controlled by t_{AA} .

APPLICATION INFORMATION

ADDRESSING

The 19 address bits required to decode 1 of the 524,288 cell locations within the TC514800AJ/AZ/AFT are multiplexed onto the 10 address inputs and latched into the on-chip address latches by externally applying two negative going TTL-level clocks.

The first clock, the Row Address Strobe ($\overline{\text{RAS}}$), latches the 10 row address bits into the chip. The second clock, the Column Address Strobe ($\overline{\text{CAS}}$), subsequently latches the 9 column address bits into the chip. Each of these signals, $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ triggers a sequence of events which are controlled by different delayed internal clocks.

The two clock chains are linked together logically in such a way that the address multiplexing operation is done outside of the critical path timing sequence for read data access. The later events in the $\overline{\text{CAS}}$ clock sequence are inhibited until the occurrence of a delayed signal derived from the $\overline{\text{RAS}}$ clock chain. The "gated $\overline{\text{CAS}}$ " feature allows the $\overline{\text{CAS}}$ clock to be externally activated as soon as the Row Address Hold Time specification (t_{RAH}) has been satisfied and the address inputs have been changed from Row address to Column address information.

Data Inputs

A write cycle is performed by bringing $\overline{\text{WRITE}}$ low during the $\overline{\text{RAS/CAS}}$ operation. The falling edge of $\overline{\text{CAS}}$ or $\overline{\text{WRITE}}$ stokes data on I/O1~I/O8 into the on-chip data latch. In an early write cycle, $\overline{\text{WRITE}}$ is brought low prior to $\overline{\text{CAS}}$ and the data is strobed in by $\overline{\text{CAS}}$ with setup and hold times referenced to this signal. In delayed write or read modify write cycle, $\overline{\text{CAS}}$ will already be low, thus the data will be strobed in by $\overline{\text{WRITE}}$ with setup and hold times referenced to these signals.

In delayed or read modify write, $\overline{\text{OE}}$ must be high to bring the output buffers to high impedance prior to impressing data on the I/O lines.

Data Outputs

The three state output buffers provide direct TTL compatibility with a fan-out of standard TTL load. Data-out is the same polarity as data-in. The outputs are in the high-impedance state until $\overline{\text{CAS}}$ is brought low. In a read cycle the outputs go active after the access time interval t_{RAC} and t_{OEA} are satisfied.

The outputs become valid after the access time has elapsed and remains valid while $\overline{\text{CAS}}$ and $\overline{\text{OE}}$ are low. $\overline{\text{CAS}}$ or $\overline{\text{OE}}$ going high returns it to a high impedance state. In an early-write cycle, the output are always in the high-impedance state. In a delayed-write or read-modify-write cycle, the outputs will follow the sequence for the read cycle.

The $\overline{\text{OE}}$ controls the impedance of the output buffers. In the logic high position the buffers will remain in a high impedance state.

When the $\overline{\text{OE}}$ input is brought to a logical low level, the output buffers are enabled. Both $\overline{\text{CAS}}$ and $\overline{\text{OE}}$ can control the outputs. Thus in read operation, either $\overline{\text{OE}}$ or $\overline{\text{CAS}}$ returning high forces the outputs into the high impedance state.

RAS ONLY REFRESH

Refresh of the dynamic cell matrix is accomplished by performing a memory cycle at each of the 1024 row addresses (A0~A8, A9R) within each 16 millisecond time interval. Although any normal memory cycle will perform the refresh operation, this function is most easily accomplished “ $\overline{\text{RAS}}$ -only” cycles, $\overline{\text{RAS}}$ only refresh results in a substantial reduction in operating power. This reduction in power is reflected in the I_{CC3} specification.

CAS BEFORE $\overline{\text{RAS}}$ REFRESH

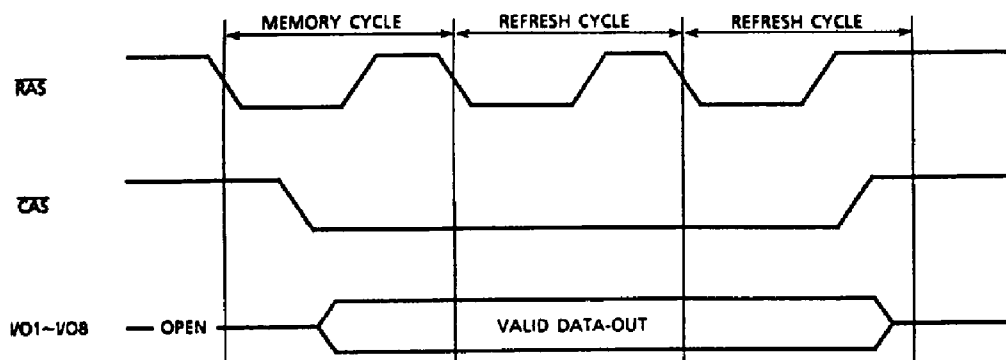

$\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refreshing available on the TC514800AJ/AZ/AFT offers an alternate refresh method. If $\overline{\text{CAS}}$ is hold on low for the specified period (t_{CSR}) before $\overline{\text{RAS}}$ goes to low, on chip refresh control clock generations and the refresh address counter are enabled, and an internal refresh operation takes place. After the refresh operation is performed, the refresh address counter is automatically incremented in preparation for the next $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh operation.

FAST PAGE MODE

The “Fast Page Mode” feature of the TC514800AJ/AZ/AFT allows for successive memory operations at multiple column locations of the same row address with increased speed without an increase in power. This is done by strobing the row address into the chip and maintaining the $\overline{\text{RAS}}$ signal at a logic 0 throughout all successive memory cycles in which the row address is common. This “Fast page Mode” of operation will not dissipate the power associated with the negative going edge of $\overline{\text{RAS}}$. Also, the time required for strobing in a new address is eliminated, thereby decreasing the access and cycle times.

HIDDEN REFRESH

An optional feature of the TC514800AJ/AZ/AFT is that refresh cycles may be performed while maintaining valid data at the output pins. This is referred to as Hidden Refresh. Hidden Refresh is performed by holding $\overline{\text{CAS}}$ at V_{LL} and taking $\overline{\text{RAS}}$ high and after a specified precharge period (t_{RP}), executing a $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycle. (see Figure below)

This feature allows a refresh cycle to be “Hidden” among data cycles without affecting the data availability.

CAS BEFORE RAS REFRESH COUNTER TEST

The internal refresh operation of TC514800AJ/AZ/AFT can be tested by "CAS BEFORE RAS REFRESH COUNTER TEST". This cycle performs READ/WRITE operation taking internal counter address as row address and the input address as column address.

The test is performed after a minimum of 8 CAS before RAS cycle as initialization cycles. The test procedure is as follows.

1. Write "0" into all the memory cells normal write mode.
2. Select one certain column address and read "0" out and write "1" in each cell be performing "CAS BEFORE RAS REFRESH COUNTER TEST (READ-MODIFY-WRITE CYCLE)". Repeat this operation 1024 times.
3. Check "1" out of 1024 bits at normal read mode , which was written at 2.
4. Using the same column as 2., read "1" out and write "0" in each cell performing "CAS BEFORE RAS REFRESH COUNTER TEST". Repeat This operation 1024 times.
5. Check "0" out of 1024 bits as normal read mode, which was written at 4.
6. Perform the above 1. to 5. to the complement data.
