## Typical Chip Assembly

## Chip Biasing options

This chip is self-biased, and flexibility is provided by the access to number of pads. the internal DC electrical schematic is given in order to use these pads in a safe way.

The two requirements are :

N°1 : Not exceed  $V_{ds} = 3.5V$  (internal Drain to Source voltage).

N°2 : Biased in such a way to limit  $V_{gs}$  positive value (internal Gate to Source voltage).

We propose two standard biasing :

Low Noise and low consumption :

$V_d = 4V$  and B & D grounded.

All the other pads non connected ( NC ).

$I_{dd} = 40mA$  &  $P_{out-1dB} = +8dBm$  Typical.

( Equivalent to A,B,C,D,E : NC and  $V_d=4V$  ;  $G1=+2.5V$  ;  $G2=+2.5V$  ).

Low Noise and high output power :

$V_d = 5V$  and B & E grounded.

All the other pads non connected ( NC ).

$I_{dd} = 75mA$  &  $P_{out-1dB} = +13dBm$  Typical.

( Equivalent to A,B,C,D,E : NC and  $V_d=5V$  ;  $G1=+2.5V$  ;  $G2=+1.0V$  ).
