### DESCRIPTION

The EDI2AG272129VxxD1 is a Synchronous/ Synchronous Burst SRAM, 72 position SO DIMM (144 contacts) Module, organized as 2x128Kx72. The Module contains four (4) Synchronous Burst Ram Devices, packaged in the industry standard JEDEC 14mmx20mm TQFP placed on a Multilayer FR4 Substrate. The module architecture is defined as a Sync/Sync Burst, Flow-Through, with support for sequential burst. This module provides High Performance, 2-1-1-1 accesses when used in Burst Mode, and used as a Synchronous Only Mode, provides a high performance cost advantage over BiCMOS asynchronous device architectures.

Synchronous Only operations are performed via strapping ADSC# Low, and ADSP# / ADV# High, which provides for Ultra Fast Accesses in Read Mode while providing for internally self-timed Early Writes.

Synchronous/Synchronous Burst operations are in relation to an externally supplied clock, Registered Address, Registered Global Write, Registered Enables as well as an Asynchronous Output enable. This Module has been defined with full flexibility, which allows individual control of each of the eight bytes, as well as Quad Words in both Read and Write Operations.

#### PIN DESCRIPTIONS

DIMM	Pins	Symbol	Type	Description
	3, 6, 7, 10, 11, 14 15, 18, 19, 20, 17 16, 13, 12, 9, 8, 5	A0-A16	Input Synchronous	Addresses: These inputs are registered and must meet the setup and hold times around the rising edge of CK. The burst counter generates internal addresses associated with A0 and A1, during burst and wait cycle.
	33, 47, 61, 75, 89, 103, 117, 131	BW1#, BW2#, BW3#, BW4#, BW5#, BW6#, BW7#, BW8#	Input Synchronous	Byte Write: A byte write is LOW for a WRITE cycle and HIGH for a READ cycle. BW0# controls DQ0-7 and DQP0, BW1# controls DQ8-15 and DQP1. BW2# controls DQ16-23 and DQP2. BW3# controls DQ24-31 and DQP3. BW4# controls DQ32-39 and DQP4. BW5# controls DQ40-47 and DQP5. BW6# controls DQ48-55 and DQP6. BW7# controls DQ56-64 and DQP7.
	32	BWE#	Input Synchronous	Write Enable: This active LOW input gates byte write operations and must meet the setup and hold times around the rising edge of CK.
	25	GW#	Input Synchronous	Global Write: This active LOW input allows a full 72-bit WRITE to occur independent of the BWE# and BWx# lines and must meet the setup and hold times around the rising edge of CK.
	30	CK	Input Synchronous	Clock: This signal registers the addresses, data, chip enables, write control and burst control inputs on its rising edge. All synchronous inputs must meet setup and hold times around the clock's rising edge.
	29, 31	E1#, E2#	Input Synchronous	Bank Enables: These active LOW inputs are used to enable each individual bank and to gate ADSP#.
	23	G#	Input	Output Enable: This active LOW asynchronous input enables the data output drivers.
	26	ADV#	Input Synchronous	Address Status Processor: This active LOW input is used to control the internal burst counter. A HIGH on this pin generates wait cycle (no address advance)
	27	ADSP#	Input Synchronous	Address Status Processor: This active LOW input, along with EL# and EH# being LOW, causes a new external address to be registered and a READ cycle is initiated using the new address.
	28	ADSC#	Input Synchronous	Address Status Controller: This active LOW input causes device to be de-selected or selected along with new external address to be registered. A READ or WRITE cycle is initiated depending upon write control inputs.
	Various	DQ0-63	Input/Output	Data Inputs/Outputs: First byte is DQ0-7, second byte is DQ8-15, third byte is DQ16-23, fourth byte is DQ24-31, fifth byte is DQ32-39, sixth byte is DQ40-47, seventh byte is DQ48-55 and the eighth byte is DQ56-64.
	38, 48, 62, 76, 90, 104, 118, 132	DQP0-7	Input/Output	Parity Inputs/Outputs: DQP0 is parity bit for DQ0-7. DQP1 is parity bit for DQ8-15. DQP2 is parity bit for DQ16-23. DQP3 is parity bit for DQ24-31. DQP4# is parity bit for DQ32-39. DQP5 is parity bit for DQ40-47. DQP6# is parity bit for DQ48-55. DQP7 is parity bit for DQ56-64 and DQP7. In order to use the device configured as a 128K x 64, the parity bits need to be tied to Vss through a 10K ohm resistor.
